An examination of this chronological view demonstrates that it is only in modern times that we begin to have a correct knowledge of the principal constituents of the atmosphere. The most important of the results of the above authors will be given in the pages of this report, and the literature of the subject will be extended to the present time, in which the chemical investigation of the atmosphere is confined to its ozone, minute solid bodies, and mismata contained therein, ammonia, &c.

Constitution of the atmosphere; its carbonic acid, oxygen, and nitrogen.

The atmosphere, when deprived of its carbonic acid and aqueous vapor, contains:

	By weight, per cent.	By volume, per cent.
Oxygen	23	21.00
Nitrogen	77	99.00
	100	100.00

In its natural condition, 10,000 volumes of air contain about 4 of carbonic acid; and 100 volumes contain an average of 0.84 watery vapor.

The proportion of oxygen in dried air does not vary sensibly, but in the natural state there is a considerable variation, due to the ever-changing quantity of water which it contains; thus with 0.84 volumes per cent. of water, the atmosphere contains 20.82 volumes per cent. instead of 21 of oxygen. In Benares, on the Ganges, where the absolute amount of moisture rises to 3.6 per cent., the oxygen volume per cent. of such an atmosphere is equal to 20.24. (Graham Otto, Lehrbuch, ch. II, part 1, p. 138.)

The carbonic acid, small in quantity though it be, is sufficient, and is as essential to vegetable life as oxygen is necessary to animal life. Animals inhale oxygen and exhale carbonic acid, while plants absorb carbonic acid, appropriate its carbon for their tissue, and reject the oxygen. A balance is thus maintained in the atmosphere like that which we are able to effect upon a small scale in an aquarium. While this small amount of carbonic acid is ample for all the vegetation upon the globe, the oxygen is in great abundance for the purposes of animal life.

Poggendorf (Handwörterbuch der Chemie, Atmosphere) has given the following curious calculation of the actual amount of oxygen present in the atmosphere, and what portion of it is needed for the respiration of the human race. He estimates the height of the atmosphere at only one geographical mile (24.555 Paris feet) of air, supposed to be of the same density throughout as that of the atmosphere at the level of the ocean, and the total volume of air to be equivalent to a cube of 210 miles side; hence the cube representing the volume of oxygen will have a side equal to 125 miles, = 1,954,570 cubic miles. An adult man consumes 26.04 Paris cubic feet of oxygen in 24 hours; in a year, therefore, 95.052 cubic feet; and the total human race, estimated at one thousand millions, would require for a year's respiration 9,505,200,000,000 cubic feet of oxygen, which equals 0.7975, or nearly $\frac{8}{10}$ of a cubic mile. If one thousand millions of persons had lived always upon the earth, and were able to consume the last atom of oxygen, the quantity present would last them 2,451,000 years; or, from Adam's time to the present they would have consumed only $\frac{1}{403}$ of the oxygen. A single tenth of a per cent. of the atmosphere would provide the whole human race with oxygen for ten thousand years. From this calculation the inference is drawn that immense quantities of oxygen might be added to or withdrawn from the atmosphere without being perceived by our most delicate methods of analysis. Estimating a loss of oxygen from the respiration of animals, combustion, and other sources of oxydation, equal to a hundred fold that caused by mankind, it would require these united causes to act for one thousand years to cause the disappearance of one per cent. of oxygen from the atmosphere. Similar calculations by Marchand and by Wackenroder establish the enormous quantity of oxygen in the air compared with that which is needed for the support of animal life. The plants restore whatever loss may arise from the above causes; but whether the compensation is absolutely exact, or whether the oxygen is steadily increasing, or in like manner diminishing, it is impossible to determine by analysis, owing to the imperfections of our instruments and processes, and the brief periods which the researches embrace.

An *exact* compensation is improbable; if there were such, there could be no carbonic acid in the atmosphere. If, again, the plants reduced as much carbonic acid as the *animals* exhale, they would increase in proportion to the quantity of this gas proceeding from combustion, volcanoes, gas-springs, &c. But it is well known that plants are constantly forming humus, and that large deposits of coal are buried in the earth. As this involves a disappearance of carbonic acid, the atmosphere was formerly richer in this gas than now. Hence the effect of plants, united with that of the moist earth and of the ocean, overcomes the effects which carbonic acid produces; the atmosphere becomes continually poorer in carbonic acid, and plants would ultimately be restricted in their growth without some other source of the gas unknown to us. To establish these conclusions it would require the most accurate determinations of the atmospheric oxygen and carbonic acid, to be performed during the period or at the intervals of a century. (Poggendorf.)

The question whether the *oxygen* in the atmosphere experiences a diminution by the respiration of men and animals, stands in intimate connection with the inquiry whether the proportion of atmospheric *carbonic acid* increases from these processes. By the oxidation of carbon to carbonic acid one volume of the latter gas arises from every volume of oxygen which disappears; consequently, a diminution in the oxygen would be accompanied by an increase in the carbonic acid. If, therefore, in one thousand years one per cent. by volume disappeared from the atmosphere, we should find in its stead *a per cent. by volume of carbonic acid*, and this increase would be the more considerable if we reckon the carbonic acid exhaled by volcanoes and other physical processes of the earth, to that arising from animal respiration; but the most accurate investigations have demonstrated that the air does not contain more than about $\frac{1}{25}$ of one per cent. of carbonic acid. It is not unreasonable, therefore, to infer that the plants, a known source of oxygen, restore this gas to the atmosphere. (Graham Otto, vol. II, part 1, page 133.)

The proportion of oxygen in the atmosphere.

Soon after the discovery of oxygen it was supposed that the purity or healthfulness of the air was due to this gas, and hence the process for determining its proportion in the atmosphere was called eudiometry. From the imperfections of analytical processes and instruments, very erroneous conclusions were reached in the early investigations. The atmospheric oxygen was first placed at from 18 to 25 per cent. by volume. Scheele found from 25 to 33, and finally 27. Lavoisier gave at first $\frac{1}{4}$, then $\frac{1}{5}$, for the proportion of oxygen in the air, and subsequently assigned between 27 and 28 per cent. by volume. The first accurate results were obtained in the commencement of the present century by Gay Lussac and Humboldt, at Paris. They found in the air of that city, by twenty-nine experiments with Volta's eudiometer, performed at all seasons and in all weathers, a minimum of 20.9, a maximum of 21.2, and a mean of 21 per cent. by volume of oxygen. Since their researches numerous determinations of oxygen have been made, and we have an accurate knowledge of the composition of the atmosphere. According to the late researches of Bunson, and those of Reiset and Regnault, the percentage of oxygen in the atmosphere is a trifle greater than was at first inferred. Bunson found 20.93 per cent. by volume, and Regnault and Reiset 20.96. If we take their mean, the atmosphere will contain by volume—

Oxygen	20.95
Nitrogen	79.05
	100.00

If we convert these numbers into per cents. by weight by multiplying them respectively by the specific gravity of the gases, we will have for the composition of the atmosphere by weight—

Oxygen	23.16
Nitrogen	76.78
	99.94

Or nearly 100, which demonstrates the accuracy of the numbers expressing the densities of these gases. In view of the important function of the atmospheric oxygen a collection of the actual results obtained by those who have determined its proportion in the air may be deemed not uninteresting.

The following are Th. De Saussure's analyses performed upon air collected upon a meadow at Chambeisy, a league from Geneva, and that from the middle of the Lake of Geneva—(Pogg. Ann. 38, p. 171 :)

De Saussure's analyses.

Place.	Day.	Wind and weather.	Oxygen, per cent. by vol.
	1836		
Lake	July 18	Clear; calm	21.08
Chambeisy	August 3	Clear; gentle NE	20.98
Do	August 16	Clear; moderate SW	21.03
Do	August 25	Clear; gentle NE	21.03
Do	August 27	Rainy; very strong SW	21.13
Do	August 27	Rainy; very strong SW	21.15
Do	September 13	Clear; gentle NE	21.08
Lake	September 13	Clear; gentle NE	21.09
Chambeisy	November 5	Cloudy; calm	20.98
Do	November 21	Cloudy; strong NE	21.086
Do	December 13	Calm; foggy	21.006
Do	December 24	Cloudy; strong NE	21.1
Do	December 28	Clear; strong NE	21.0
Lake	December 29	Clear; weak SW	21.04
		Average	21.05

Bunsen's analyses of air establish the accuracy of his process. They differ at the most $\frac{3}{100}$ p. c., and are as follows—(Handwörterbuch der Chemie:)

Table of Bunsen's analyses.

Date.	PERCENTAGE OF OXYGEN BY VOLUME BY—	
	1st analysis.	2d analysis.
January 9	20.973	20.958
January 18	20.928	20.901
January 20	20.923	20.927
January 24	20.921	20.943
January 26	20.927	20.934
January 28	20.928	20.911
January 30	20.889	20.892
February 1	20.840	20.871
February 3	20.925	20.940
February 5	20.937	20.952

Regnault, (Comptes-Rendus, xxvi, pp. 11, 156, 233; also Jour. Pr. Chemie 44, p. 49, and 43, p. 166,) in an extensive series of analyses of air performed at Paris from December 24 to 31, 1847, ascertained the percentage of oxygen to be from 20.9 to 21 by volume; and during January, 1848, from 20.89 to 20.99; and that the analyses of specimens of air taken at different times during the same day gave results which varied within these limits.

The same author (C. R., xxxiv, 863) gives the following results of a number of analyses which, in pursuance of a plan conceived in the year 1848, were performed upon specimens of air collected at noon on the 1st and 15th of each month in as many places as possible. He estimates the error of analysis to be not above 0.02 per cent. From these results Regnault estimates the normal variations of oxygen to be from 20.9 to 21.0; but asserts that in tropical regions it can sink to 20.3.

Table of Regnault's analyses.

Experiments.	OXYGEN PER CENT. BY VOLUME.	
	Minimum.	Maximum.
More than 100 specimens of air from Paris and environs, 1848	20.913	20.999
Nine specimens from Lyons, Montpellier, St. Martin aux Arbres	20.918	20.966
Thirty specimens at Berlin, 1848–'49	20.908	20.998
Ten specimens at Madrid, 1848	20.916	20.982
Twenty-three specimens at Genoa, Mont Saleve, and Mont Buet	20.909	20.993
Fifteen specimens at roadstead of Toulon, Mediterranean Sea, and Algiers harbor	20.912	20.982
Five specimens, passage from Liverpool to Vera Cruz	20.918	20.965
One specimen at Gullalamba, Ecuador	20.960	.....
Two specimens at Pichincha—higher than Mont Blanc	20.949	20.988
Average oxygen in Paris and environs	20.96	.....
Twenty-nine specimens of air collected by Ross in the polar seas in 1848–'49	20.9	.....

Stas (Jr. Pr. Chemie, xxvi, p. 297) performed at Brussels twelve analyses of atmospheric air collected at different times, and obtained a percentage of oxygen (by weight) which varied from 23.04 to 23.08. On two occasions, without knowledge of any error, he found 23.11 and 23.14. He thus found the composition of the air of Brussels to be the same as that of Paris, Geneva, and Copenhagen, and confirmed the observation

made at Paris, that, from some unknown cause, sudden changes at times modify the composition of the air.

Boussingault (Ann. de Ch. et de Phys., series 3, vol. iii, p. 281) determined the oxygen at different elevations and obtained the following average results:

Boussingault's analyses.

Locality.	Elevation above the sea, in meters.	Percentage of oxygen, by volume.
Santa Fé de Bogota	2,650	20.65
Ibaqué	1,323	20.70
Mariquita	548	20.77
Average		20.70

The following table comprehends the results of Dumas and Boussingault. (Ann. de Ch. et de Phys., 3, III, 304.) The experiments were performed at Paris with different wind and weather:

Table of Dumas's and Boussingault's analyses.

Day.	Barometer, *m.m.*	Thermometer, C°.	Wind.	Sky.	Oxygen, p. c., by weight.
April 27, 1841	759.5	23°	S.	Clear	22.92
April 28, 1841	758.3	25°	SE.	Clear	23.06
April 29, 1841	757.6	27°	NW.	Clear	23.03
May 29, 1841	759.7	17°4	N.	Rain	23.01
July 20, 1841	753.9	19°	S.	Rain	23.00
July 21, 1841	752.1	14°7	SW.	Clear	23.00
July 24, 1841	758.2	17°8	N.NW.	Clouded	23.08
September 20, 1841	758.9	22°6	N.	Clear	23.07
September 22, 1841	751.2	21°	S.SW.	Clouded	22.89
Average					23.007

The following simultaneous analyses of air were performed at different places—(Ann. de Ch. et de Phys., 3, III, 301 :)

Table.

A. At Paris, by Dumas and Boussingault. Garden of Dumas's laboratory.

Day.	Hour.	Weather.	Oxygen, per cent., by weight.
July 20, 1841	1½ to 5 p. m	Sky clouded; rain during experiment	23.05
July 21, 1841	11½ p. m	Sky clear	23.00
July 24, 1841	10 a. m. to 2 p. m.	Sky clear; no wind	23.07
		Average	23.04

B. At Berne, Switzerland, by Brunner.

Day.	Hour.	Weather.	Oxygen, per cent., by weight.
July 20, 1841	.....	Slightly cloudy; west wind	23.00
July 21, 1841	11 p. m	Sky cloudy	22.89
July 24, 1841	7 to 8 a. m.....	Clear.....	22.97
July 24, 1841	7 to 9 p. m.....	.....	22.96
		Average.....	22.95

C. Faulhorn Mountain, Switzerland, by Martin and Bravais. This air was taken at the "*Hospice*," twelve meters below the summit of the mountain, and 2,683 meters above the sea level.

Day.	Hour.	Weather.	Oxygen, per cent., by weight.
July 20, 1841.....	9 a. m	Clear, fine 36 hours.....	22.96
July 21, 1841.....	6 to 11 p. m..	Cumuli over the whole sky.....	23.10
July 24, 1841.....	7 to 8 a. m...	Snow previous night—fog.....	22.95
July 24, 1841.....	6 to 7 p. m...	Fog disappearing, wind southwest.	22.85
August 7, 1841.....	4 to 4½ p. m..	Sky clear for 48 hours.....	22.97
		Average	22.97

Laskowski (Ann. de Ch. et de Pharmacie) examined the air of Moscow during the cholera epidemic from November 3 to 11, 1847, and found by 14 experiments from 20.73 to 20.89 volume per cent. of oxygen, and a mean of 20.82.

Dumas (Comptes Rendus XIV, 379) communicated to the French Academy the following results obtained by several chemists who had zealously devoted themselves to the analysis of the following atmosphere:

Table of Marignac's analyses.

A. Marignac, Geneva, 1842.

Date.	Per cent., by weight.
January 11	23.01
January 18	23.00
February 3	22.97
Average	22.98

B. Lewy, at Copenhagen.
I. In the court-yard of the Polytechnic Institute.

Date.	Time.	Weather.	Oxygen, per cent., by weight.
November 17	4 p. m.	Snow	23.00
November 30	M	Clouded	23.02
December 12	10.30 a. m	Clear	22.96
December 15	12.30 p. m	Clear	22.99
December 22	11.30 a. m	Snow	23.01
		Average	22.996

II. Air at sea, (the Baltic.)

Day.	Time.	North latitude.	West longitude, from Paris.	Oxygen, per cent., by weight.
		° ′	° ′	
August 4	8.30 a. m.	57 56	8 22	22.57
August 3	10.45 a. m.	55 30	5 30	22.58
August 2	1 p. m.	52 36	0 58	22.59
August 3	1.15 a. m.	54 15	2 7	22.56
Average				22.575

III. Analysis of air from the sea-coast, with a sea wind, at 35 feet above the ocean level. Air received at the Fortress Kronburd, 12 miles from Copenhagen.

Day.	Time.	Weather.	Wind.	Oxygen, per cent., by weight.
February 18	9.30 a. m.	Clouded	NE.	23.02
February	do.	do	NE.	23.01
February	do.	do	NE.	23.02
Average				23.016

The mean of the results at Geneva is exactly the same as that obtained at Paris.

The air of Copenhagen has also the same composition. The sea air contains less oxygen at the ocean level, but at an elevation of 35 feet it possesses the same composition as that of the interior of the country.

Verver found in the air of Gröingen 22.998 per cent. by weight of oxygen.

The contamination of the atmosphere by the products of human life and industry in cities does not diminish to a serious extent its proportion of oxygen. This is shown by the following experiments of Dr. R. Angus Smith (Qr. Jour. Chem. Soc., xi, 299) upon the air of Manchester. The diminution of oxygen constitutes from 0.1 to 0.2 per cent. by volume, although with gusts of smoke it may be greater.

Table of the air of Manchester, by Dr. Angus Smith.

Specimen No.	Remarks.	Oxygen, per cent., by volume.
1	Air collected at different times in Manchester	20.868
2		20.179
3		20.807
4		20.613
5		20.793
	Mean of numbers 1, 3, 4, and 5	20.770

The following table (compiled from Gmelin's chemistry) comprises the results of observations upon the atmospheric oxygen made by different analyses. Some of the numbers appear to be inadmissible; I quote them, however, for the sake of the general view of the subject:

Table of oxygen analyses by various observers.

Observer.	Remarks.	Oxygen, per ct. by volume.
Berthollet	In Cairo and in Paris	Nearly 22.0
De Marty	Catalonia, under all circumstances and in inhabited rooms	21–22
Sir H. Davy	Bristol, other parts of England, on the coast, at sea and in air, from the coast of Guinea.	21
Berger	Jura, mountains and valleys of Savoy, upon the glaciers and in the Wallis Valley.	20.3–20.65
Configliachi	Simplon, Mt. Cenis, and other Alps	21
Do	Upon marshes	21
Do	Upon rice fields	20.8
Do	In confined places	20.3
G. Lussac and Humboldt.	Paris, under all circumstances	20.9–21.1
Gay Lussac	In Paris, and at 6.636 meters above the earth in a balloon	21.49
A. Vogel and Krüger	Over the Baltic Ocean	20.59
Hermbstädt	On the coast of the Baltic Ocean, 5 feet above its level	21.5
Do	On the coast of the Baltic Ocean, 16 feet above its level	20.5
Do	In the country	20.0
Marchand	From 10 analyses of air, from 20.9–21.03 mean	20.97
Dalton	In England, usually	20.7–20.7
Do	In England, occasionally	21
Do	In England, maximum January 8, 1825, wind N. E	21.15
Do	In England, air, from Helvellyn, 3,000 feet high	20.64
Do	In England, Manchester	20.99
Do	In England, Helvellyn	20.63
Do	In England, Manchester	20.73
Do	In England, Snowdon, 3,570 feet elevation	20.70
Do	In England, from the plain, three miles from Manchester	20.85
Do	In England, air collected in a balloon, by Grafton, 9,660 feet high.	20.70
Do	In England, Manchester	20.83
Do	In England, air, by Green, balloon 15,000 feet high	20.62
Do	In England, Manchester	20.93
Do	Air, from Mer de Glace Chamounix, 6,000 feet high	19.80
Do	Air, from Simplon, 6,174 feet high	19.76
Do	Air, from Wengern Alp, 6,230 feet high	20.28
Th. Thompson	In Glasgow, average of numerous experiments	21.01
Kupffer	In the air of Kasan	21–21.2
Brunner	In Switzerland, in the valley	21.07
Do	In Switzerland, lakes	20.85
Do	In Switzerland, upon the Faulhorn	20.915
Green	Air, by a balloon, 11,300 feet high	21
Baumgartner	Air, in Vienna, during the cholera	20.4–21.4
Schiel	In the air of the prairies of North America; elevation above ocean 2,330 feet.	0.91

From these results we perceive, first, that the normal proportion of oxygen in the atmosphere has been determined with very considerable precision; and, second, that an analysis determining the amount of this gas in the air of an inhabited apartment will afford no data for estimating the character of its ventilation.

II. ANALYSES DETERMINING THE CARBONIC ACID IN THE ATMOSPHERE.

More important, for the purposes of this research, is the question of the proportion of carbonic acid in the air. This gas, when present in excess, is poisonous to animal life. It accumulates in inclosed places by the breathing of men and animals when not removed by the introduction of fresh air.

The proportion of carbonic acid which is actually injurious to life is unknown, and there is much difference of opinion as to how much can be borne with safety; probably a very small excess over the normal quantity in the atmosphere would prove hurtful if it acted continually upon the system. Hence it becomes important, where there is a question of ventilation, to ascertain the normal quantity present in the atmosphere, and to increase the ventilation as near to that point as may be consistent with other effects to be produced, such as warmth, absence of currents, and the like. I proceed to give the results of analyses of the atmosphere, and of the air of inhabited rooms, so that we may be able to compare them with similar results which I have obtained in Washington.

From the healthful nature of country air when compared with that of cities, we might expect to find a *much* smaller amount of carbonic acid in the air of the former compared with that of the latter; but experiments do not warrant this assumption, and we must assign the insalubrity of cities to other causes.

Dr. R. Angus Smith (Quarterly Jour. Chem. Soc., xi, 196) has shown this by an extended research into the air of towns, selecting for his experiments a city of which the air should be much contaminated by the results of human industry.

This locality is Manchester, England, with its environs, a district comprehending many hundred square miles, every portion of which is influenced by the smoke of manufactories consuming bituminous coal, and of which we have not the like in any portion of our own country. Dr. Smith says that the tinge of darkness in the atmosphere, arising from the smoke, may be seen making a line of at least forty miles in length, and affecting vegetation injuriously, (by the deposition of carbon;) thus influencing the character both of the sky and of the landscape.

Two millions of tons of coal are burned annually in this city. It is interesting to calculate the amount of carbonic acid gas which the combustion of this coal would add to that arising from the breath of the inhabitants, and that normally present in the atmosphere. Dr. Smith supposes that the smoke may influence the air to an elevation of 600 feet, and gives the following estimate of its effect upon the atmosphere:

	Carb. acid, per cent. by volume.
On a space of 16 square miles, 60 feet high, the consumption of this amount of coal yields the following	1.6499
The amount already in the air is, say	0.06
Suppose that 400,000 inhabitants exhale 266 cubic feet of air, containing 6 per cent. of carbonic acid, there would be 330 tons, or volumes per cent	0.0362
Hence in the air there would be	1.7461

If this were changed ten times per day, the per cent. of carbonic acid in the air, at any given period, would be—

From coal	0.16499
From breath	0.00362
The normal quantity	0.06
	0.22861

If changed 20 times, we would have—

From coal	0.08248
From breath	0.0018
Normal	0.06
	0.14428

But assuming the height influenced to be 300 feet instead of 60, and the air to be changed ten times, then we would have—

From coal	0.033
From breath	0.00072
Normal	0.06
	0.09372

By the observations of Mr. Hartnup, the air at Liverpool has an average speed of 12.62 miles per hour. If we suppose it to be 12 miles at Manchester, it would sweep over four miles thirty-six times in twelve hours. This would give, for a height of 30 feet, of carbonic acid—

From coal	0.0091
From breath	0.0002
Normal	0.06
	0.0693

And assuming the air outside of the city to contain 0.03 per cent. of normal carbonic acid, we would have then—

From coal	0.0091
From breath	0.0002
Normal	0.0300
	0.0393

The last results accord, as well as can be expected, with the following analyses by Dr. Smith. The analyses were effected by drawing a known quantity of air through tubes containing substances capable of depriving it of moisture and carbonic acid. The weather was remarkably open and fine, and the results were sometimes lower than those calculated for the air in the country. When much wind is blowing they average from 4.5 to 8, and with little wind from 10 to 12 volumes of carbonic acid in 10,000 of air.

Table of Dr. Angus Smith's analysis.

The following table contains additional results obtained by Smith by a method of analysis in which manganate of potassa was employed in determining the carbonic acid. This method has not been sufficiently tested to warrant confidence in its accuracy, although the results accord pretty well with each other.

Table of analyses, (Dr. R. A. Smith,) in which manganate of potassa was employed.

The elder De Saussure observed the presence of carbonic acid in the atmosphere of the summit of Mont Blanc, in the region of continual snow. The younger De Saussure investigated, at Geneva, the proportion of this gas in the air, in a research which has become classical, and of which the results are accepted yet as among the most, if not the most, accurate of any which we possess.

The following table (Pogg. Annalen, xix, p. 426) comprises some of the results of Th. De Saussure's analyses, quoted by Dr. Gilm, (K. Acad., Wien, xxiv, p. 279 :)

Table of De Saussure's analyses.

	Car. acid in 10,000 vols. of air.
1827—November 6	4.06
1827—November 14	4.16
1827—November 21	3.91
1827—December 5	4.06
1827—December 22	4.18
1827—December 27	4.13
1830—January 3	4.79
1829—January 28	4.26
1829—February 21	3.66
1827—February 19	3.58
1829—February 19	4.26
1829—March 7	4.25
1829—March 12	4.25
Average	4.12

De Saussure's experiments extended over the years 1827–'29, and embraced the number of 225 analyses. They were performed at Geneva, and on the estate of the author, at Chambeisy, a village lying upon a dry, airy meadow, (with clay soil,) 16 meters above Lake Geneva, and ¾ of a league distant from the city of the same name. Comparative experiments were also made upon the air of the lowlands and that of the mountains.

The following compend of the results of these most interesting experiments (Handwörterbuch der Chemie Poggendorf, Liebig, &c.; art. Atmosphere) illustrates their value:

Compend of Th. De Saussure's analyses.

In Chambeisy, four feet above the ground, the amount of carbonic acid, at all times and seasons, deduced from 104 analyses, is—

	Car. acid per. 10,000 vols.
Minimum	3.15
Maximum	5.74
Mean	4.15

By separating the results by day and night, we have, by day—

Minimum	3.15
Maximum	5.40
Mean	3.38

And by night, viz:

Minimum	3.21
Maximum	5.74
Mean	4.32

From which it appears that the amount by day is less than by night. At noon the carbonic acid was lower with a gentle than with a strong wind; thus—

With a gentle wind, mean	3.76
With a strong wind, mean	3.98

The effect of rain could not be determined by comparing the results at Chambeisy with those obtained simultaneously at Geneva, because, with much rain in Geneva a smaller amount of carbonic acid was found at Chambeisy, and inversely. De Saussure considers the uniform moistening of the ground by gentle rain more productive of carbonic acid than by a strong rain. It acts by cooling the ground. Frost also increases the carbonic acid.

Thirty six comparative experiments at Chambeisy and in the middle of Lake Geneva, four feet above its level, gave—

For Chambeisy, mean	4.60
For the lake, mean	4.39
For the lake, minimum	3.42
For the lake, maximum	5.78

Thirty comparative experiments between the air of Chambeisy and that of a street in Geneva yielded—

For Geneva	4.68
For Chambeisy	4.37

The day observations gave the above results; those of the night yielded a smaller proportion for the town than for the country.

Finally, De Saussure observed that the proportion of carbonic acid was greater on the tops of mountains than in the plains or valleys, as may be seen from the following, (Pogg. Ann., xix, 422, and Karsten, Alg. Encyk. d. Physik Lieferung, iii, p. 26, Meteorologie:)

Table of De Saussure's analyses. (Carbonic acid on mountains.)

By the side of these experiments of Saussure, showing that the proportion of carbonic acid is greater in the more elevated regions, (as Gay Lussac also found was the case by experiments upon air collected during his aerostatic journey,) may be placed those of Messrs. Schlagintweit.

These chemists investigated the air of the Alps. H. and A. Schlagintweit (Pogg. Ann., lxxvi, 442) found that in the air of the eastern Alps the carbonic acid increased progressively, according to the elevation, to 3,366 meters, which height they believe to be the limit of a constant maximum. Their results yielded from 3.2 to 5.8 per 10,000 volumes.

A. Schlagintweit, (Pogg. Ann., lxxxvi, 293,) in an examination of the air of the Western Alps, in the neighborhood of Monte Rosa, confirmed the above results. At the height of from 3,162 to 4,224 meters, when the air was clear, it contained a mean amount of 7.9, and a maximum quantity of 9.5 carbonic acid. When the place of observation was enveloped in a dense cloud, which extended to the lower valleys, the proportion of carbonic acid sank to 5.9. At Berlin (elevation 32.5 meters) S. found by three observations 3.9 to 4.5 carbonic acid. The following table gives the details of these results:

Méne has published the results of numerous experiments upon the carbonic acid of the atmosphere, (Comptes Rendus, xxxiii, pp. 39, 222; xxiii, p. 39; lvii, 155, &c.) He gives the same amount of carbonic acid in the air for the months of December and January. From February to May it increases; from June to August it diminishes, and from September to November it increases again; so that in October the air is richest in this constituent. During the night the carbonic acid is less than in the daytime. During the day there is a slight increase toward noon. After a rain the carbonic acid increases.

The following are Méne's experiments upon the atmosphere in Paris, tested at different elevations upon the Pantheon. Méne infers that at a certain elevation there is less carbonic acid than at the surface of the ground.(?)

Table of Méne's experiment.

Date.	Time of experiment.	Carbonic acid per 10,000 vols. of air.

	Average	2.315

Henry H. Watson (Rep. 4th meeting British Association, p. 583) made an extensive research upon the atmospheric carbonic acid in Bolton, England, and in the neighborhood, from which he inferred the air of the city to be richer in that gas. The method of analysis employed is similar to that proposed by Pettenkoffer. A solution of lime-water was used for absorption; the strength of the solution in lime, before and after the absorption, being determined by sulphuric acid.

The following table embraces his results.

Horrock's Moor lies three miles to the northwest from Bolton, and is by barometric observation 544 feet higher.

Winter Hill is between five and six miles northwest from Bolton, and 1,211 feet higher. The west and northwest winds blow from the sea.

Watson does not agree with De Saussure in finding uniform differences corresponding to the different seasons and dry or wet weather, and attributes the actual differences in this respect rather to the unavoidable errors of analysis.

Table of analyses by Watson.

* Very strong wind. † Air taken during a thick fog.

Gilm (Sitzung's Bericht des Math. Natur. Classe des K. Acad. Wein, xxiv, 279) has given a number of analyses of the air, drawn from a garden at Innsbruck, according to his process, which has been described in a former page of this report. In these analyses he employed thirty liters of air, which passed through the apparatus in three hours. In testing the accuracy of his method, he determined by it the amount of carbonic acid liberated from 0.2 gram of carbonate of baryta, with the following satisfactory result:

Carbonic acid.

Lewy (Comptes Rendus, xxxiii, 345; Jour. Pr. Ch., liv. 249, &c.) has made an extended research upon the atmospheric carbonic acid and oxygen, comparing the results obtained in Europe with those of the air of the Atlantic Ocean and of South America. He employed the analytical method of Regnault and Peiset. He found that the greatest difference between two analyses never amounted to more than $\frac{1}{10000}$, and most frequently $\frac{1}{100000}$.

The mean of analyses performed at eleven different places in New Granada yielded for normal air per 10,000 volumes:

Carbonic acid	4.008
Oxygen	2101.425
Nitrogen	7894.555

This result agrees with his observations upon the atmosphere of Europe.

The variations which he detected in the constituents depend upon the meteorological conditions. Thus, after a long rainy season there was less carbonic acid and oxygen than after a prolonged dry season. For example, by the examination of a large number of specimens of normal air of Bogota he found:

Atmospheric air.	During the rainy season; cloudy sky.	During the dry season, clear sky.
Carbonic acid	3.822	4.573
Oxygen	2099.542	2102.195
Nitrogen	7896.630	7893.232
In volumes of air	10000.000	10000.000

This demonstrates a difference, in favor of the dry season, of 0.751 carbonic acid, and 2.653 oxygen.

Taking the maximum and minimum of his results for the two seasons respectively, he found:

Atmospheric air.	Minima for the rainy season.	Maxima for the dry season.
Carbonic acid	3.609	5.043
Oxygen	2099.032	2103.199
Nitrogen	7891.758	7891.758
In volumes of air	10000.000	10000.000

The greatest difference, therefore, amounts to 1.434 for the carbonic acid, and 4.167 for the oxygen. These differences, he states, are almost the same as those found at Paris in meteorological conditions corresponding to the dry and rainy seasons of South America.

New Granada afforded Lewy very interesting results as to abnormal conditions of the air. During the extensive conflagrations for agricultural purposes, called *las quemas*, he discovered as much as 49 volumes of carbonic acid per 10,000 of air, the oxygen having at the same time experienced a diminution of 68.35 per 10,000. In the city of Santa Fé de Bogota he found at times an enormous quantity of carbonic acid in the air, which he attributes to volcanic agencies. Thus in 1850, during the months of May to July, the air contained from 3 to 4, and in the month of August the large quantity of 47 volumes of carbonic acid per 10,000; and he asserts that he is fully convinced of the accuracy of his method of analysis.

At sea Lewy discovered a larger proportion of carbonic acid and oxygen in the air by day than at night—a difference equal to 2.07 for the carbonic acid, and 9.96 for the oxygen. He attributes this to the action of the sunlight upon the ocean, liberating the gases which it holds in solution, and which are richer in oxygen and carbonic acid than atmospheric air. Thus, in air taken at a distance of four hundred leagues from the coast, upon the same day and with the same wind, he found:

Atmospheric air.	At 3 a. m.	At 3 p. m.
Carbonic acid	3.346	5.420
Oxygen	2096.139	2106.099
Nitrogen	7900.515	7888.481
In volumes of air	10000.000	10000.000

The following table, compiled by E. E. Schmid (Art. Meteorologie, Karsten's Encyklopädie des Physik) from the Annales de Chimie et de Physique, 3d ser., vol. xxxiv, comprises the results of Lewy's interesting research:

Table of Lewy's analyses of the atmosphere.

1. AIR OF GUADELOUPE.

It may be observed with respect to these experiments, that at the beginning of the dry season the trees are cut down for agricultural purposes, so that they may be burned just before the rainy season. These conflagrations (called "*las quemas*") last for several days; they are most extensive during the latter part of August and beginning of September, and take place also to a less extent toward the end of February and beginning of March. Volcanic craters, at a short distance from Bogota, also pour carbonic acid at intervals into the atmosphere. On September 2, 1850, the summit of Montserrat was enveloped in a dark gray vail of vapor; the air was so oppressive that many persons were affected, breathing with difficulty. On September 4 it began to rain, and by the 9th the rainy season had fairly commenced, while "*las quemas*" had ceased in the immediate and remote neighborhood of Bogota. On a former occasion, (Ann. Ch. and de Phys., ser. 3, vol. viii., p. 450,) on November 20, 1842, at Guadelupe, Lewy detected 147.6 parts of carbonic acid in 10,000 volumes of air; and on the 23d of that month 89.0 carbonic acid; while in the dense tropical vegetation of the mangrove thickets upon the river Salee—and due, no doubt, to the decomposition of carbonic acid by the action of an energetic vegetable life—the amount of this gas falls to 2.6. If these results of Lewy be correct, the great excess of carbonic acid in the atmosphere of the locality observed has its origin in volcanic emanations; and Lewy infers from his experiments that its presence is not due to a disappearance of oxygen. The air was collected in exhausted globes, and the analysis was performed by Dumas and Boussingault's process, by which the oxygen is absorbed by copper heated to redness, and the carbonic acid is obtained by absorption by caustic potassa.

The foregoing analyses give a clear view of our knowledge of the atmospheric carbonic acid. Before proceeding to the analysis of the air of inhabited apartments, I will cite an example from the air of badly-ventilated mines, in which, from the earth, from the breath and light of the miners, and from the combustion of gunpowder, the air has become deteriorated. The following results were obtained by Mr. Heywood, (Tomlinson's Rud. Treatise on Warming and Ventilation, p. 256,) from the analysis of 18 samples of air from mines in Cornwall and Devon:

Oxygen (by volume)	17.067
Nitrogen (by volume)	82.848
Carbonic acid	0.085
	100.000

In one instance he found only 14.51 oxygen, and in another as much as 0.23 carbonic acid.

Dr. R. Angus Smith, (Quar. Jour. of Science, April, 1865, p. 222,) in an essay upon the salubrity of mines, gives the following table for the percentage of oxygen in the air resulting from five or six hundred analyses:

Analyses of air varying in the amount of oxygen per cent. by volume.

Northeast seashore and open heath of Scotland	20.999
Tops of hills—Scotland	20.98
Base of hills—Scotland	20.98
Suburb of Manchester in wet weather	20.98
Front street ¾ mile from Exchange—(dry)	20.945
Back of house	20.936
Unhealthy parts of Perth, favorable—windy day	20.935
Fog and frost in Manchester	20.91
Sitting room which felt close	20.89
After six hours of a petroleum lamp	20.83
Pit of a theater	20.74
Gallery	20.36
When candles go out, from presence of carbonic acid	18.5
Difficult to remain in, from presence of carbonic acid	17.2

Summary of analyses of air in mines—oxygen.

Average in 339 specimens	20.26
Lowest	18.27
Average in large spaces	20.77
Currents	20.65
Just under shafts	20.424
In ends	20.18
In swamps	20.14
In all other places	20.32

Analyses of atmospheres varying in carbonic acid.

	Average carbonic acid, per 10,000 volumes.
Manchester streets—usual	4.03
During fogs	6.79
About middens	7.74
Average	4.42
Average fogs excepted	4.24
Average fogs and middens excepted	4.03
Where the fields begin	3.69
In close buildings	16.04
Minimum of suburbs	2.91
Over north Scotland, (towns excepted)	3.36
Candle goes out	180 to 250
Lowest found in mines	250.
Lowest entered for experiment	400.
Average of the mines	78.5

III. CARBONIC ACID IN THE AIR OF APARTMENTS.

Leblanc (Jour. Pr. Ch., xxvii, p. 215, and Comptes Rendus, Juin, 1842, p. 862) made an extensive series of analyses of the air of different inhabited apartments of Paris, comprising chambers, lecture-rooms, hospitals, &c. He determined the constituents of the air in most instances by the method of Dumas and Boussingault, but in some cases he ascertained the carbonic acid by Brunner's process. Leblanc's results are given in the original by weight; I have therefore recalculated them for volumes, using for the purpose the specific gravities of Erdmann's and Marchand's tables. I have also added a column of the relative amount of carbonic acid present, assuming four volumes in 10,000 of air as a unit of measure. It will be seen from these analyses (column of numbers 1, 2, and 3) that vegetation in greenhouses diminishes the amount of carbonic acid which is normally in the air; that in an *ordinary* sleeping apartment for two persons the ventilation from accidental causes is superior; that in such *crowded* apartments the carbonic acid is in great excess from insufficient ventilation, which is also the case for lecture-rooms, schools, and dormitories of hospitals.

I would call especial attention to the analyses of the air of the chamber of deputies and of the opera comique, both ventilated artificially with the greatest care, so that we may compare these results with those obtained in the Capitol extension.

Leblanc's results are interesting in respect to the death of animals in artificial atmospheres. Thus a small bird died in a room containing less carbonic acid than existed in the air of the majority of the apartments examined, and a dog survived longer in air containing the enormous amount of 1,991 volumes per 10,000 of carbonic acid than in an atmosphere from burning charcoal in which 301 volumes of this gas were present. The cause of the latter superior deadly effect is attributable to the presence of the very poisonous gas, carbonic oxide, emitted by the charcoal.

Table of Leblanc's analyses of the air of badly ventilated apartments.

No. of analysis.	Air collected from—	Oxygen, in 10,000 dry air, per volume.	Carbonic acid, in 10,000 dry air, per volume.	Relative carbonic acid, that of air, = 4 volumes per 10,000.	Capacity of room.	No. of individuals.	Hours that the apartment was closed.	Volume air per person while apartment was closed.	Volume air per hour and per person.	Remarks.

Raymond de Luna (Jahresbericht, xiii, 107, estudios quimicos sobre el aire atmosferico de Madrid, 1860) has made an investigation, containing the following results of experiments upon the air of Madrid:

Raymond de Luna's analyses.

Locality.	Carbonic acid, per 10,000 volumes of air.	Relative carbonic acid.
Princess' hospital, Madrid	30.00	5.8
General hospital, Madrid	43.00	8.3
Within the walls of the city of Madrid	5.17	1.0
Without the walls of the city of Madrid	4.50	
Air of a bedroom on rising in the morning	48.00	9.2
After ventilating the same for two hours	16.00	3.0

Pettenkoffer, (Abhandlung Bayr. Acad. der Wissenschaften II, pp. 1, 19, 69; also in Jour. Pr. Ch. lxxxv, 165,) in an extensive series of experiments performed according to his method of analysis for determining carbonic acid, obtained the results contained in the following table.

It will be observed that the air of ordinary and not crowded rooms is not deficient in ventilation, which takes place through the *walls* and crevices; (see ex. 12, 13, &c;) that there are differences in degrees for the ventilation of such rooms, and when they have from 5 to 9 per 10,000 per volume of carbonic acid, which is equal to 1.1—2.0 relative carbonic acid, they are free from any closeness to the senses.

Crowded rooms, lecture and school rooms, provided with no artificial ventilation, have an accumulation of carbonic acid to a dangerous degree.

Experiments 17–20 show the escape of carbonic acid by diffusion through the walls and crevices.

Table of Pettenkoffer's analyses of the air of rooms.

No. of analysis.	Remarks.	Carbonic acid in 10,000 volumes.	Relative carbonic acid, 4.5 = 1.0.

Dr. Hammond (Hygiene with reference to the military service) gives the following results of his examination of the air of the army hospitals:

Table of analyses of air of army hospitals.

Remarks.	Carbonic acid, per 10,000 volumes of air.	Relative carbonic acid.
External air	3.7	1.0
Air in the hospitals of best ventilation	6.8	1.8
Air in the hospitals of worst ventilation	21.1	5.7
Air in a bedroom on rising	9.5	2.6
Air of a bedroom after ventilating for three hours	4.3	1.2

Peclet (Nouveaux Documents Relatifs au Chauffage et à la Ventilation, Paris, 1853) gives the following results of experiments by Leblanc upon the condition of, I, a ventilated cell in the prison Mazas; II, of a similar cell not ventilated.

The experiments were performed by the action of a committee comprising Arago, Gay Lussac, Pouillet, Dumas, Boussingault, Andral, Péclet, Leblanc, and others.

In cell No. I a ventilation of six cubic meters of air per hour was insufficient to remove the odor extending into the cell from the siége d'aisance; but ten cubic meters were effectual for the purpose. The experimentor was confined in the cell during ten hours with a candle, which was lighted during 2½ hours after closing the doors. The ventilation No. I was at the rate of 10 cubic meters per hour, except for the first two hours, when it was somewhat less. During the first few hours the experimentor experienced a slight feeling of disgust in consequence of the insufficient ventilation, but this passed away completely.

Table of Leblanc's experiments on the ventilation of the prison Mazas.

Locality.	Carbonic acid, per 10,000 volumes.	Relative carbonic acid. Unity = 5.0 per 10,000.	Relative humidity.	Remarks.

Lassaigne (l'Institut, No. 654, July 15, 1846, p. 240, and Jour. Pr. Ch., xlvi, p. 287) performed some experiments upon the composition of the air in unventilated places which had served for the respiration of men and horses. The determination was effected by absorption by caustic potassa. In the first two experiments the air was taken after a lecture which had lasted two hours; all the crevices of the apartment having been closed as effectually as possible. As may be perceived, the amount of carbonic acid present is enormous, being, as in the case of a cell in the prison Mazas, as much as four times the normal quantity contained in the atmosphere.

Table of Lassaigne's experiments upon unventilated rooms.

Experiment.	Locality.	Capacity, cubic meters.	Individuals present.	Remarks.	Carbonic acid, per 10,000 volumes of air.	Relative carbonic acid. The air of Paris = 5 = 1,00.

Loppens (l'Institut, 1845, p. 26) obtained the following results in the air of a theater at Ghent. These experiments, like those of Lassaigne and others, establish the fact that the carbonic acid of an unventilated room is uniformly diffused therein, the slight difference being in favor of the ceiling, and not of the floor, as was formerly ignorantly assumed from the superior specific weight of this gas:

Table of Loppens's experiments on a theater.

Air of the theater at Ghent.	Carbonic acid, per volume, per 10,000.		Relative carbonic acid, that of air = 5 = 1.	
	Minimum.	Maximum.	Minimum.	Maximum.

From above the galleries.....	43.9	53.6	8.8	10.7

Roscoe (Qr. Jour. Ch. Soc., x, 251) obtained the following interesting results of an "investigation for the purpose of supplying chemical data respecting the warming

and ventilation of private dwelling-houses, including barracks, under a commission appointed for that purpose by the general board of health" in London. Roscoe assumes that the following are the conditions of the deterioration of air in such localities:

1. The presence of an excessive quantity of carbonic acid or of other gases.
2. Too much or too little moisture.
3. The presence of organic putrescent bodies, the effluvia arising from the decomposition of animal or vegetable matter.
4. Inconvenient elevation of temperature.

Roscoe assumes the proportion of carbonic acid in a room which has served for respiration to be the measure of the deterioration arising from the breath, with respect both to the carbonic acid and to the putrescent matters exhaled.

The following table comprises Roscoe's results. The experiments were performed by aspirating a known volume of air, absorbing the moisture by *sulphuric acid*, and the carbonic acid by *caustic potassa*, both contained in tubes filled with fragments of pumice-stone:

Table of Roscoe's experiments upon ventilation.

* Not determined. † Moderately full.

Roscoe also performed experiments upon the escape of carbonic acid through the crevices of a room, and by diffusion through its walls. The results accord with those obtained independently by Pettenkoffer, and demonstrate that a large amount of carbonic acid escapes from an unventilated room in this way. In experiment I, carbonic acid was evolved in a room containing two persons. The flue was closed and was without fire. All the doors (four) and windows (two) were shut. The capacity of the room was 2,560 cubic feet. The following are the results:

Experiment I.

Carbonic acid determined at consecutive half hours gave—	At 0h. 0m.	At 0h. 30m.	At 1h. 0m.	At 1h. 30m.
Volume of carbonic acid per 10,000 volumes of air.....	72.07	33.10	30.99	30.99

It is thus seen that the carbonic acid diminishes in half an hour from 0.7 to 0.3 per cent. of the total volume of air, although the direct ventilation was checked. Roscoe supposes that the permanency of 3 per cent. carbonic acid after the first half hour is due to the respiration of the two persons in the confined atmosphere.

Experiment II was instituted for the pupose of ascertaining the diffusion of carbonic acid through brick and mortar walls. For this purpose a brick was cemented with pitch into the end of a box lined with pitch, and of the dimensions 3 feet by 9 inches by 4½ inches. Carbonic acid was led into the box by two tubes cemented into the sides. After the box had stood for sufficient time to permit a uniform mixture of the gases, samples were taken in consecutive hours, collected in a tube over mercury, and the proportion of carbonic acid in the air determined. In order to control errors arising from a leakage of the box, another experiment was performed, in which the whole brick was covered with pitch and the leakage thus determined.

Experiment II.

Carbonic acid determined at consecutive hours.	At 0h.	At 1h.	At 2h.	LOSS OF CARBONIC ACID BY DIFFERENCE IN PER CENTS.		
	1.	2.	3.	In 1st hour.	In 2d hour.	Total in 2 hours.
Samples.....	16.96	14.22	12.17	2.74	2.05	4.79

The experiment with a brick pitched all over showed a loss by leakage in two hours of 1.54 per cent. of carbonic acid. Hence the amount of carbonic acid which diffused through the naked brick in two hours = 4.79 — 1.54 = 3.25, or a total of 16 per cent. of carbonic acid. In other words, when an inclosed space contained 16 per cent. of carbonic acid, three and a quarter per cent. escaped through a solid brick in two hours.

II.—ANALYSES AND OBSERVATIONS AT THE CAPITOL.

GENERAL DATA AND RESULTS.

The following table comprises the data obtained and the results which have been deduced from my experiments upon the ventilation of the Capitol extension. The first and second columns contain the places of observation and the consecutive order of experiments, and columns 3 and 4 their dates and hours. Columns 5, 6, 7, 12, and 13 give the data for calculating the volume of carbonic acid contained in 10,000 volumes of air. These data are not given for the experiments of June 30, 1864, on account of the imperfection of the apparatus employed at that date. I regard these experiments as approximately correct, but without the confidence attaching to those performed in the present year. Columns 9 and 10 contain the data for computing 11, the relative humidities of the air, in which 100 is taken as the point of saturation with moisture of air of the respective temperatures. The inferences to be drawn from the experiments upon moisture are deferred to a subsequent page.

Let us consider, in the present connection, columns 14, 15, and 16, which concern the proportion found for the carbonic acid of the air in the apartments in question, and a comparison of the quantity of this gas with that already existing in the external atmosphere.

Table of data and results of the determination of the carbonic acid and relative humidity of the air in connection with the ventilation of the Capitol extension.

[a] Carbonic acid 2.686 = 1.

A discussion of the inferences to be drawn from the results of the experiments upon carbonic acid embraced in the preceding table will be facilitated by considering them in the following groups:

1. OF THE EXTERNAL AIR.

The close agreement between two analyses of the same air, performed simultaneously, demonstrates the accuracy of the results, and repays the labor incurred in the careful preparation of the tests and apparatus employed in the investigation. Collecting the means of all of the analyses of the external air, we have the following group:

Carbonic acid per volume in 10,000 *of external air. Mean results.*

	Carbonic acid.
1864—June 30	3.258
1865—February 8	2.709
1865—February 9	2.649
1865—February 16	2.711
1865—February 24	2 648
1865—March 28	2.686
Mean from February 8	2.68
Difference from mean	0.031

From which it is seen that the mean volume of carbonic acid per 10,000 at Washington, in the winter, was 2.68, and in the summer, on June 30, 3.26. While not desiring to assign to the analysis of June 30 too great weight, it may be remarked that it was performed upon air collected during a breeze, immediately before a storm, and that it has been shown that under such circumstances the lower strata of air are enriched by the larger proportion of carbonic acid contained in the upper regions.

The small amount of carbonic acid obtained by the analyses is remarkable. The care bestowed upon the experiments and the accordance of the results precludes the supposition of error. If an error exists, it must be always present, and varying in an exact proportion to the carbonic acid; but the method of analysis has been tested by Pettenkoffer and Gilm in a series of comparative experiments with satisfactory results.

The following summary shows the proportion of carbonic acid in the atmosphere obtained by other observers:

Carbonic acid in the atmosphere, per volume, per 10,000.

Observer.	Carbonic acid.	Remarks.
De Saussure	5.74	Maximum }
Do	3.15	Minimum } of 104 analyses.
Do	4.15	Mean }
Gilm	4.6	Maximum }
Do	3.8	Minimum } of 19 analyses.
Do	4.15	Mean }
R. Angus Smith	2.2	Hills near Preston.
Do	3.0	At Blackpool.
Marchand	3.1	Mean of 104 analyses.
Mène	2.3 (?)	Mean of 12 analyses.

Four ten-thousandths is the mean proportion of carbonic acid in the atmosphere accepted universally for all seasons and other conditions. From this average there are variations for different conditions. Whether the small amount found for Washington be due to the locality, or be general in the United States, (as is most probable,) I cannot determine, not having been able to discover records of any analyses bearing upon the question. It is probable that Europe, from the greater density of its population, and from the comparative poverty in forest, contains a larger proportion of carbonic acid in the atmosphere than does our country. A research on this subject is much needed. The experiments of Lewy, in South America, throw no light upon the matter, as they exhibit great and sudden changes in the carbonic acid of the air, due to

volcanic action. In the dense tropical vegetation of that country, Lewy found in the groves a considerable diminution of carbonic acid.

Le Blanc also found in the air of the hot-houses of the Jardin des Plantes from 0.9 to 0.6 carbonic acid per 10,000 of air.

2. AIR OF THE HALLS OF CONGRESS.

The mean results of the several analyses may be regarded as very correct. The agreement of the numbers obtained in the analysis of two specimens of the same air is very close—more so, indeed, than was expected from the presence in the neighborhood of the apparatus of persons who took naturally a great interest in the proceedings, and whose movements would tend to the production of currents which might influence the results of the analysis.

The experiments were performed upon air collected at different points and elevations. The air on the floor was compared with that in the galleries, and with that escaping from the ventilators in the illuminating loft.

The experiments were performed in the winter and in the summer, by day and at night, and with various conditions of heat, moisture, storms, barometer, number of individuals present, &c. The following small table gives the mean results:

Table of means of carbonic acid, per 10,000 *volumes.*

In the legislative halls.	Floor.	Galleries.	Illuminating loft.	Mean.
House of Representatives, June 30, 1864.—Fair audience; storm	5.5	4.5	.....	5.0
Senate, February 9, 1865.—Fair audience; clouds and wind	5.7	4.0	4.6	4.8
House of Representatives, February 16, 1865.—Small audience, rain	3.5	3.5	3.9	3.6
Senate, February 24, night.—Galleries crowded; cold and clear	4.6	4.8	*7.3	4.7
Mean of all of the experiments on the halls	.....	.....	.....	4.5

*Not included in the mean; is due to the gas-lights, 1,500 flames, burning above the ceiling

These results are wonderful, and *demonstrate a very superior ventilation, or renewal of the air.* They show less carbonic acid than was obtained by observers in Europe in the analysis of the external atmosphere, and if carbonic acid be a potent cause of insalubrity in unventilated rooms, our legislators breathe an air more free from this gas than the atmosphere of the Alps. (See page 37 of this report.) This is due to the rapid exchange of the air, and to the small amount of carbonic acid contained therein.

It will be perceived from the experiments that this gas is very uniformly diffused throughout the halls, showing a regular and equable ventilation.

With a uniform velocity of the fan, the carbonic acid of the experiments is inversely proportional to the size of the audience; but from the large volume of air delivered the difference is not very great.

In the experiments in the Senate chamber at night, February 24, I have noted the revolutions at forty-five per minute, as I measured them at 10 p. m.; but the engineer assured me that the fan had been making fifty revolutions per minute during the whole of the evening.

It follows from these observations that the ventilation is as good at night with a crowded hall as in the day-time, but that the velocity of the fan must be attended to to obtain sufficient renewal of the air.

The night experiments demonstrate that while carbonic acid accumulates to a certain extent in the illuminating loft—a phenomenon due to the immense combustion of gas—it has no perceptible effect upon the ventilation. The excess is carried off by the current more rapidly than it can diffuse itself into the hall.

If we now compare the proportion of carbonic acid in our legislative halls with that obtained by observers for other similar places, we shall find an extreme excellence in favor of the ventilation of the Capitol extension. To effect this comparison, I have made an extensive search into the English, German, French, and American scientific journals, and have been surprised to find how little has been done with so interesting a subject.

To enable a fair comparison, I have embodied in the following tables the *relative amount* of carbonic acid in the air of the halls and other apartments—that is, the actual

quantity of carbonic acid obtained divided by the normal amount of the same gas in the external atmosphere:

Tables of the relative amount of carbonic acid.

A consideration of these tables will show that the ventilation of the halls of Congress is far superior to the ventilation of the French Chamber of Deputies, or of any other large, well-filled apartment in Europe upon which experiments have been recorded, and is the same as that of our airy and well-ventilated private dwellings. In the latter, according to Pettenkoffer's experiments, with which my own accord, a room having in its air a relative carbonic acid of 2.0—that is, twice as much as exists in the external and normal air—is free from any closeness. The ventilation of the halls of legislation falls within this limit.

Experiments 64 and 65, in the table of data and results, were performed upon the air of my own sleeping apartment, which is a fine, large room of 5,700 cubic feet capacity, and remarkably free from closeness. Doors (three) and windows (two) were situated in three of the sides of the room, and upon the fourth was an anthracite coal fire in a grate. When the air of experiment 64 was taken, the room had been aired, and was unoccupied, and the result demonstrated a relative amount of carbonic acid = 1; that is, of equal purity with the external air. Several persons occupied the room in the evening, and two adults and two small children slept in it. The air of experiment 65 was taken the next morning, immediately upon rising, and yielded a relative carbonic acid = 2, showing thus that a good ventilation had been effected by the action of the fire in the grate. General Morin (Experiences sur les effets de ventilation produits par les cheminées d'appartement. Comptes Rendus, lvi, p. 16, 1863) performed experiments upon the ventilating effect of chimneys and the crevices of doors, windows, &c., upon an office in the Conservatoire des Arts et Métiers. The room could be heated at pleasure by an open fire or by the register of a hot-air furnace. It was occupied usually by a single person, although from ten to twelve assembled there occasionally for a few moments. Under these circumstances the room was sufficiently ventilated by the sole action of the chimney, without fire. The quantity of air evacuated by the chimney was determined from its velocity, which was measured, first, for the action of the hot-air furnace alone, and, second, for a fire in the chimney. He experimented also with fires of wood, coal, and illuminating gas.

When the external air had the temperature of from 35.24° to 50° Fahrenheit, and

the interior temperature ranged from 64.4° to 71.6°, the chimney withdrew from the room 400 cubic meters per hour, which is equal to 235½ cubic feet per minute.

The furnace introduced 154 cubic meters of hot air of temperature between 127° and 212° Fahrenheit, consequently 246 cubic meters per hour, equal to 144.8 cubic feet per minute, entered the apartment by the crevices of the doors and windows; from which it appears that an abundant ventilation was effected by the action of the chimney.

The dwellings of citizens in the ordinary circles of life are generally well ventilated for the number of persons usually within them. This ventilation is effected, by the usual construction of houses, through accidental sources; that is, the ventilation was not kept in view in the plan. Experience has shown it to be sufficient in most of these cases, and hence the general attention has been diverted from the importance of ventilating larger and more crowded rooms in which persons are detained for a comparatively short time.

It would prove satisfactory if the ventilation of public halls approached the condition of the ordinary houses of our more affluent citizens; but in general they vie with the crowded and small habitations of the poor in an impure atmosphere. The experiments performed have shown that the halls of Congress are free from this defect, and that they possess a superior ventilation. The fault which some have found with them arises, as will be shown directly, from a deficiency not of *air*, but of *moisture*.

The public schools of Washington, of which the air was examined, were not situated in buildings constructed for the purpose. They are not as deficient in ventilation as the schools of France, England, and Germany, on which we have experiments; but are yet too much so to secure that important desideratum in the education of the young, "a sound mind in a sound body." It is understood that these school-rooms are merely temporary, and it is to be hoped that no delay will occur in the change of their pupils to rooms more conducive to health.

Air from the top of the dome.—It having been supposed by some that the introduction of fresh air from a great elevation would secure a purer atmosphere for the purposes of ventilation, I performed experiments (84, 85, 86) upon the external air taken from the top of the dome, comparing it with that received near the level of the ground, upon the first platform of the steps ascending the main portico of the Capitol. De Saussure, Gay Lussac, Schlagintweit, and others obtained a *larger proportion of carbonic acid* in the superior strata of the atmosphere; my results confirmed this fact for the difference of level between the ground and summit of the dome. Placing the proportion of carbonic acid in the former at 1, the relative carbonic acid at the summit of the dome=1.06. The wind was from the southeast, and consequently not from the densely peopled portion of the city. Probably an air coming from the city would have been found still richer in carbonic acid, which had proceeded from the chimneys of the dwellings and manufactories. Hence it was thown to be undesirable, as concerns the carbonic acid, to receive the air from too great an elevation.

III. THE QUANTITY OF FRESH AIR INTRODUCED BY THE FANS.

The carbonic acid evolved by the respiration of an audience is diluted with air to a degree depending upon the volume of fresh air introduced by the fans.

If, therefore, we know the proportion of carbonic acid in the external air and in that of an apartment, and also the number of individuals present, we can calculate, approximately, the volume of air which has been introduced. This is the chemical determination of the degree of ventilation; it has been effected by Roscoe, for his experiment No. IV, in the following manner:

If we assume, as an average of the experiments performed by different observers, that a man exhales 0.686 cubic feet of carbonic acid per hour, 16 men will exhale in six hours 65.86 cubic feet, and it is required to know with how much air, containing 0.04 per cent. of carbonic acid, these 65.86 cubic feet must be mingled to yield an air of 0.1242 per cent. of carbonic acid, as found by the analysis. Since the fresh air to be added contains carbonic acid, we require more of it that we would need were it free from that gas.

Let V represent the volume of air free from carbonic acid that would be required, and a the fraction which the impurity in the air (0.04) is of the limit of impurity in the mixtures (0.1242;) and let V^1 represent the volume of normal air that we require, then:

$$V^1 = V + V\,a + V a^2 \;.\;.\;.\;.\;.\; + V^n$$

It will be sufficient to calculate the three first terms only of this expression:

$$0.1242 : 99.8758 :: 65.86 : V = 52961.7;$$

$$a = \frac{0.04}{0.1242} = 0.322;$$

$$\text{and } a^2 = 0.103684.$$

Employing these numbers in computing the value of V^1, we find that V^1 is equal to 75,500 cubic feet of fresh air which have passed into the room in six hours, carrying off 0.1242 of its bulk of carbonic acid.

This volume of air is equal to a ventilation of 13.1 cubic feet of air per man and per minute, and was found sufficient (by observation) to remove all unpleasant odors.

By a direct experiment upon the velocity of air escaping through the chimney, Roscoe found a ventilation from this source equal to two cubic feet per man and per minute; consequently the bulk of vitiated air passes off through accidental sources of ventilation, such as crevices in the doors and windows, and by diffusion of the carbonic acid through the walls.

Calculation of the ventilation of the Senate by the chemical method.—In Roscoe's calculation he obtains the number 76,600 for the cubic feet of air in six hours instead of 75,500. The former gives to each man a volume of 13.3 cubic feet of air per minute. He employs in his computation 0.686 cubic feet of carbonic acid per hour as the quantity exhaled by an average man, while upon a previous page he accepts 0 699 cubic feet as the mean of the experiments of several observers. In the following calculation let us assume the latter number, and suppose that 1,000 persons were present in the Senate chamber upon the evening of February 24, 1865, when experiments 66, 67, 68, 69, and 70 were performed.

By these experiments the carbonic acid in the external air was 2.648 per 10,000, and the proportion of this gas in the air collected on the floor was 4.557; consequently $a = \frac{0.02648}{0.04557}$. A thousand men will exhale 699 cubic feet of carbonic acid in an hour; V, therefore, will equal 2,639,030 cubic feet; and V^1 will be found by calculation to equal 5,073,619 cubic feet of fresh air required in an hour, or 84,560 cubic feet per minute, to reduce the carbonic acid exhaled by 1,000 men to a dilution of 0.04557 per cent. This is equal to 84½ cubic feet per man and per minute.

The power of the fan has been estimated by its builders at 60,000 cubic feet per minute, or 60 cubic feet per person for a thousand individuals.

I have assumed an audience of only 1,000 persons in this calculation, which is probably too low, as the floor and galleries were crowded, as is usual toward the close of the session.

An audience of 1,400 persons would have 60.4 cubic feet per minute for 84,560 cubic feet of fresh air; consequently the inference from the chemical method of determining the amount of ventilation shows that the fan possesses the power that it was supposed to have.

Experiments upon the velocity of the air leaving the fan.—I regret, for the want of a delicate wind-wheel, to have been unable to test directly the velocities of the air-currents in the air-ducts of entrance and exit. My experiments do not, indeed, leave any question as to the amount of ventilation unanswered, which would have been settled by such an investigation, but it would have been interesting to have compared the results afforded by the velocities and by analyses.

I performed, however, the following experiments with an anemometer, or syphon manometer, placed at my disposal by the architect, upon the velocity of the air as it enters the main duct, applying the instrument to a hole which I found prepared for it in the fan-room:

IV. VELOCITY AND QUANTITY OF AIR ENTERING THE MAIN AIR-DUCT OF THE HOUSE OF REPRESENTATIVES.

Table of results for March 30, 1865.

Revolutions of the fan per minute.	A—velocity of the air—feet per second.	C—cubic feet of air—feet per minute.	C—cubic ft. per minute, less one-tenth.	C—cubic feet of air per minute and person, for 1,000 of audience.
45	18.08	61694	55525	55.5
50	21.52	73430	66087	66.0
60	23.48	80117	72105	72.1
65	25.26	86215	77593	77.6

As the results of the analysis in the House of Representatives did not differ much from those of the Senate, we may find a confirmation of the degree of ventilation, as calculated by the chemical method, in the results of these experiments upon the velocity of the air current.

With a moderate degree of care in the management of the fan, we can be sure of at least from fifty to sixty cubic feet of air per minute and person,* which is an excessive amount of ventilation, as will be seen from a consideration of what has been proposed and effected in Europe. With this velocity I have not, in moving about the halls to perform the experiments, perceived any unpleasant currents, which is, of course, an important consideration.

V. THE DEGREE OF VENTILATION EXISTING IN SOME OF THE PUBLIC EDIFICES OF EUROPE.

Several of the public edifices of Europe have been subjected to a careful examination by scientific men of the first rank as to the degree of ventilation existing in their apartments. It is interesting to compare the results obtained, and the volumes of air deemed necessary for a proper ventilation, with those of our Capitol.

Péclet, Morin, and others devoted to this branch of investigation, arrive at the actual amount of fresh air introduced by an examination of the velocity of the air currents entering and leaving the apartment.

That degree of ventilation is deemed sufficient which permits no persistence of bad odor in the place to be ventilated.

This, however, is a very uncertain criterion, and the only correct method of ascertaining the proportion of fresh air needed for a perfect ventilation would result in combining the study of the velocity of the air currents with the determination of the relative amount of carbonic acid in the air of the inhabited apartment, which has, in fact, been effected in the present investigation.

Judging from the odor, General Morin assumes that 23.5 to 35.3 cubic feet of air per minute and patient are scarcely sufficient for the ventilation of the hospital Beaujon;† and Péclet, in criticising these results, thinks that they are too high, and hopes for the sake of humanity that some other source of insalubrity, as unwashed bed-clothes or unwhitewashed walls, made the necessity for so large a ventilation improperly apparent.

Peclet himself assumes from 5.9 to 11.8 cubic feet per person and minute as a proper ventilation; and yet, according to the experiments in the prison Mazas, this quantity was insufficient to restrain the odor of the close-stool, when without water, from the cell, while 3.5 cubic feet of air per minute were insufficient to remove the odor under any circumstances.

An odorous body, such as musk, or as may be found exhaling into the air from unclean, or even from some kinds of clean men, will assert itself against even a powerful ventilation. If an odor be manifested for a few minutes and then be removed, we can judge of the degree of ventilation from the rapidity with which it becomes imperceptible; but if the perfume be constantly emitted, we can draw no such conclusions.

In a close and badly ventilated bedroom the *unpleasant odor* perceived the next morning upon entering it from the fresh air is not from the substance which is the cause of its insalubrity, but is an index or measure of the carbonic acid also present, and which is in too great excess for health. The physiological effects or physical symptoms of a bad ventilation are the same as those produced by carbonic acid. We cannot yet correctly estimate the part which morborific emanations from the body, or miasmatic substances in the air, perform to cause disease. The former would, of course, be removed from an apartment by ventilation; but atmospheric miasms would be brought to the individuals of an audience more abundantly the greater the ventilation. With respect to the actual degree of ventilation necessary for health there is great difference of opinion. In estimating this amount for an assemblage of persons we can, of course, only regard the average man. As Dr. Luther Bell (Ventilation, p. 104) correctly states, we must strike a mean of ventilation and heat. "The rubicund, four-bottled country squire, and the exsanguined and aged ecclesiastic, cannot be measured by the same scale without one or the other suffering."

The following volumes of air in cubic feet per person and minute have been assigned by different experimenters:

Dr. Arnott	2 to 3
Tredgold	4
Mr. Toynbee	10
Dr. Bell	10 to 25
Peclet, according to circumstances	10 to 20
Peclet, at least	5

---

* Mr. Robert Briggs, one of the builders of the ventilating machinery, calculates the minimum ventilation of the halls at 50,000 cubic feet of air per minute for the hall of Representatives, and 30,000 for the Senate, and the maximum amount, for summer use, at double these volumes.

† In the hospital Lariboisière, from the mean of the results of three experimenters, 41.5 cubic feet per minute and patient were afforded. (Morin, Études sur la Ventilation, p. 418; ed. 1863.) To make the results comparable, I have reduced all cubic meters per hour per person to cubic feet per minute and per person, (cubic meter=35.32 cubic feet;) also temperature to Fahrenheit.

Roscoe, (insufficient in barracks)	10
Roscoe requires at least	20
Dr. Reid, (minimum)	10
Dr. Reid requires, according to circumstances	20 to 60*
Vierordt	2½

In a pamphlet on the laws of health, by Dr. E. A. Parker, reviewed in Qr. Jour-Science, January, 1865, the author concludes from the results of a number of experiments (made by others) on the quantity of carbonic acid expired and of oxygen consumed during twenty-four hours by a human being, that in order to render the products of transpiration and respiration inocuous, 33⅓ cubic feet of fresh air per minute are required. And when gas-lights are burning in a room, it must be remembered that each flame consumes as much oxygen and gives out as much carbonic acid as *five* human beings.

Peclet estimates the space occupied by an average individual at one square foot of floor-surface, and calculates the height of a room to contain an hour's supply of fresh air upon this basis, at fifty-four feet.

In Peclet's *Nouveaux Documens Relatifs au Chauffage et à la Ventilation des Etablissements Publics, Paris*, 1853, may be found the following results of experiments performed upon the degree of ventilation of certain apartments in France:

In the prison Mazas, examined by a commission of scientific and practical men, three and a half cubic feet of fresh air per minute were found insufficient to maintain the purity of air in one of the cells. A ventilation of 5.9 cubic feet was deemed satisfactory for the cell with one inmate with a burning candle, which gave, by experiment, a proportion of carbonic acid in the air equal to four and a quarter times (by volume) the quantity existing in the external atmosphere. For this degree of ventilation the temperature of the apartment conducive to health and comfort was placed at 60° Fahrenheit.

The church of St. Roche, examined by a commission during the winter of 1845–'46, was found to have a capacity of 32,000 cubic meters. Its ventilation was at the rate of 10,000 cubic meters per hour, and renewed the air eight times during the day. As the church would contain 3,200 persons, it would afford to each person 10 cubic meters of air for an hour; that is, 5.9 cubic feet per minute.

The Salle des Sciences de l'Institut, examined by M. Cheronnet, with an audience of one hundred and eighty persons, and ventilated by the draught of a chimney, according to the plans of Mr. Duvoir-Leblanc, afforded to each person per minute 16.6 cubic feet of air. In a second experiment the volume of air afforded was 17.3 cubic feet.

L'hôpital du Nord.—A commission of *savans* appointed to decide upon different plans submitted for the ventilation of this hospital, accepted that which gave to each bed per minute from 11.8 to 23.5 cubic feet per hour.

Experiments upon the large lecture-room of the Conservatoire des Arts et des Métiers, by General Morin, yielded the following results, (Peclet Op. cit., p. 49:)

For the most active ventilation.

February 14	For 775 persons..	8.88	Cubic feet per minute and person.		
February 18	For 850 persons..	8.83	Do.	do.	do.
February 27	For 800 persons..	9.18	Do.	do.	do.
Mean		8.96	Do.	do.	do.

For the less active ventilation.

March 7	For 800 persons.	5.24	Cubic feet per minute and person.		
March 8	....do....do	5.41	Do.	do.	do.
March 12	....do....do	6.47	Do.	do.	do.
Mean		5.71	Do.	do.	do.

General Morin has published some experiments upon the lecture-rooms of the Conservatoire, later than the preceding, in the Comptes Rendus for 1863, (vol. lvi, p. 201.) These apartments are, a large rectangular one, capable of containing from 700 to 800 persons, and a smaller one, which is semicircular, and which will not accommodate more than 400 individuals. They are warmed by a hot-air furnace, and are both ventilated by the draught of one chimney. The ventilation is principally a downward one. Particular experiments demonstrated that a temperature of 64.4° Fahrenheit was insuffi-

*Reid required for British House of Commons 60.

cient for the comfort of either the lecturer or of the audience, but had to range from 68° to 69.8° Fahrenheit. The mean temperature of the rooms, in two series of observations with a variable number of auditors, was, for the first series, 67.64° Fahrenheit, and for the second series, 67.46° Fahrenheit. In the smaller room there were furnished 56.9 cubic feet of fresh air per minute and person. In the large room this volume was 14.38 cubic feet. In the smaller room there was no odor in the air, either of the apartment or of the exit-duct. In the larger room the air was free from odor, but the smell was perceptible in the exit-duct. From these experiments Morin infers the necessity of a *minimum* ventilation of 14 cubic feet per person and minute. General Morin has also (Comptes Rendus, lvi, p. 365, 1863) investigated the ventilation of the new theaters of Paris with the following results:

Theâtre Lyrique.—September 24, 1862, temperature, 71.6° Fahrenheit; and that of the external air, 62.2°; ventilation, 24.01 cubic feet per minute and seat. By a second experiment, December 9, temperature, 71.6°; of external air, 46.4° Fahrenheit; ventilation, 24.02.

Theâtre de la Gaieté.—January 13, 1862, air evacuated per seat, per minute, equaled 17.17 cubic feet.

Theâtre du Cirque.—August 11, 1862. The air evacuated equaled 21.19 cubic feet per minute and seat. When examined again, on January 13, 1863, after the adoption of an ill-advised plan, the ventilation had fallen to 10.47 cubic feet.

The Chamber of Peers of France, in the Luxembourg palace, was ventilated by M. Talabot, in 1860, upon plans tested and approved by Thenard, Gay Lussac, Pouillet, and Peclet. The current is determined by a pair of fan-wheels, aided by a gas-burner placed in a circular aperture in the ceiling. The apparatus in full action withdrew 425,700 cubic feet per hour. In summer the ventilation is effected by the aid of an additional pair of fans, the gas-burner being disused. The ventilation varies from 7 to 12 cubic feet per minute and person.

In the Pentonville Model Prison the ventilation yields from 30 to 45 cubic feet per minute to each person.

Hood (Warming and Ventilation, p. 261) estimates the air required for ventilation by the amount needed to take up the moisture from the skin and lungs. The air required for respiration (*i. e.*, oxidation) is very much less than that needed to hold in solution the vapor of the skin and lungs, which evolves 12 grains of water per minute.* If the temperature of a room be at 60°, with a dew-point of 45°, a cubic foot of its air will absord 2¼ grains of vapor; or, in other words, the perspiration from the body will saturate 5¼ cubic feet of air per minute. If, however, we take the dew-point lower, say not to exceed 20° or 24°, then 3¼ cubic feet of air per minute will be required to carry off the insensible perspiration; while for the pulmonary supply ¼ cubic foot will be needed, making a total of four cubic feet. In summer, as the dew-point is higher, more air will be needed, viz, 5 cubic feet per minute for summer ventilation.

From the preceding examples, calculations, and considerations, it will be admitted that the degree of ventilation of the Capitol extension is superior to any of the halls described in respect to the volume of fresh air furnished.

The House of Representatives, with a capacity of 465,372 cubic feet, may be supplied with 60,000 cubic feet of air per minute, which will change the whole air every seven minutes and furnish to each of a thousand persons 60 cubic feet per minute.

This amount of ventilation appears to be excessive, and I think that it might be diminished with advantage and economy, if the chief defect of the air, viz, its want of moisture in the winter, were remedied.

III. UPON RESPIRATION.

It is not possible, nor is it, indeed, necessary, to enter, in this report, upon the interesting question of the physiology of respiration. Some remarks may, however, be permitted.

I. PRODUCTS OF RESPIRATION.

Professor Miles, in his report upon the ventilation of dwelling-houses and schools, assumes that if the temperature of the air range from 65° to 70° Fahrenheit, we will have the following average results for the—

Respiration of an adult:

Number of respirations per minute	20
Cubic inches of air inhaled at each respiration	20
Cubic inches of air inhaled per minute	400
Cubic inches of oxygen at each respiration	4
Cubic inches of oxygen per minute	80

*According to Seguin, the maximum loss of water during 24 hours from the lungs and skin, as insensible perspiration, is, for an individual, 5 pounds; the minimum being 1¾ pounds. The average exhalation per minute is, for the lungs, 7; for the skin, 11; total, 18 grains. Carpenter (Physiology, p. 532) assigns six grains per minute as the average exhalation of water by the lungs. (See, also, v Gorup Besanez Physiologie.)

Products respired:

1. Damaged atmosphere with nitrogen in excess.
2. Fifteen cubic inches of carbonic acid gas.
3. Three grains of vapor of water.
4. The surrounding air is vitiated by the mixture of the products of respiration with it at the rate 2½ cubic feet per minute.

The quantity of air inhaled at each respiration has been found to be different by different observers, owing to the difficulty of determining it with accuracy; thus:

Herbert assigns	20 to 30		cubic inches
Valentin	14	92	"
Vierordt	10	42	"
Coathupe	16	..	"
Hutchinson, average	16	20	"
Hutchinson, extreme	7	77	"

Assuming 20 cubic inches to be the average quantity, the volume of air remaining in the lungs, and which *cannot* be expelled, is estimated at from 75 to 100 cubic inches, and the quantity which can be expelled by a *forced expiration* is as much more; the sum of the two being from 150 to 200 cubic inches, which is from 7½ to 10 times the breathing volume. From these considerations it will be perceived that something more than the respiratory act is required to exchange for oxygen the carbonic acid contained in the lungs. This exchange is effected by the law of the diffusion of gases, a phenomenon which takes place with great rapidity. (Carpenter's Physiology.) Draper (Physiology, p. 153) found that a little bubble of shellac blown upon the end of a glass tube permitted the passage of ammonia. If a bottle be rinsed out with ammonia, and a soap bubble be blown in it by means of a glass tube, a rod moistened with hydrochloric acid placed at the other end of the tube gives *instantaneous* evidence of the presence of ammonia by the formation of copious white fumes. Thus a rapid change of the air in the lungs is effected. Grehant (Comptes Rendus, lv., p. 278) finds the act of respiration to be a true ventilating process. He inhaled a certain volume of hydrogen gas, and determined, in the same volume of exhaled gases, the proportion of air and hydrogen. It followed that, by the inhalation of 500 cubic centimeters of pure air, the same volume, by expiration, contains ⅛ of pure and ⅞ of spoiled air; also that the ⅞ of pure air remaining in the lungs become uniformly diffused through the air-passages after two respirations. The total volume of air respired daily varies, according to different authorities, from 366⅓ cubic feet to 398½ cubic feet; whence 800 cubic feet have been assigned as the minimum quantity of air that can be safely allowed for each individual confined in any room. (Carpenter.) Air which already contains carbonic acid does not exchange by diffusion and endosmosis with that vitiated in the lungs as readily as pure air. Messrs. Allen and Pepys found that when 300 cubic inches of air were respired for *three minutes*, only 28 cubic inches of carbonic acid were found in it, although the previous rate of its production, taking the air fresh at every respiration, was 32 cubic inches per *minute*. The unhealthfulness of unventilated rooms, therefore, increases in a larger ratio than the respective amounts of carbonic acid found in them.

II. THE AMOUNT OF CARBONIC ACID EVOLVED IN RESPIRATION

is important, as it enables us to calculate the amount of fresh air needed in an apartment to maintain a proper degree of purity. In the calculation from the data of my experiments (p. 62) I have assumed, with Roscoe, 0.699 cubic feet per hour (=0.01165 cubic feet per minute) as the amount of carbonic acid exhaled by an average man.

This is the mean of experiments by Scharling, who obtained 0.618, and of Vierordt and Hutchinson, who obtained 0.780 cubic feet per hour. Andral and Gavaret, (Jour. Pr. Ch., xxix, 331,) Scharling, (Id., xxxvi and xlviii,) Hervies and Saint-Sager, (Comptes Rendus, xxviii, 260,) and others, have published experiments upon this subject, from which it appears that the variation in the amount of carbonic acid exhaled from the lungs and skin depends upon the temperature of the surrounding medium, age, sex, development of the body, state of health or disease, muscular exertion or repose, sleep or watchfulness, period of the day, and state of the digestive process.

Laissaigne, (Jour. Pr. Ch., xlvi, p. 287,) by a calculation based upon the analysis of the air of an unventilated room, having deducted the carbonic acid normally in the air, and having allowed for the air displaced from the room by the audience, (the bulk for an average man, with clothing, having been ascertained, by immersion in a bath, to be 2¾ cubic feet,) determined the exhalation of *carbonic acid* to be 1,083.86 cubic inches for the average man in health, or a little less than ⅛ of his own volume per hour.

This agrees with the experiments already given by Scharling, which, in cubic inches, is 1069.2, and is not far from those by Vierordt and Hutchinson, which are, cubic inches, 1,348; mean, 1,209 cubic inches per hour.

By a similar calculation upon the air of stables, he found that a horse breathes out

13,409 cubic inches, or 0.328 of his volume, in carbonic acid per hour, and that the ratio of the hourly quantities exhaled by a man and by a horse are as 1 to 12.3.

An ox exhales in an hour	16,545 cubic inches carbonic acid.
A ram, of eight months	3,371 cubic inches carbonic acid.
A goat, of eight years	1,311 cubic inches carbonic acid.
A kid, of five months	708 cubic inches carbonic acid.
A hound	1,117 cubic inches carbonic acid.

Pettenkoffer and C. Voit (Kopp and Wills Jahresbericght, 1862, 523, and 1863, 635) have made an extensive series of observations upon the respiration of dogs, in the "respiration and perspiration apparatus," constructed in Munich by the munificence of the King of Bavaria. They found that atmospheric air contains (normally) no other appreciable carbon compound except carbonic acid, and that the proportion of hydrogen is also inappreciable. For every 416–428 grams of carbonic acid in the breath of dogs, they discovered from 4.3 to 7.2 of *hydrogen*, and from 3.7 to 63 of hydrocarbons. They found that the sum of the carbon, hydrogen, oxygen, and nitrogen expelled from the body in 24 hours was equal to the sum of these elements taken in the food. They observed also that the separation of carbonic acid by the skin and lungs exhibits a considerable variation in quantity; thus, by a generous diet, they found three times the quantity than obtained after a ten day's fast.

J. Reiset, (Comptes Rendus, lvi, 740,) who investigated the process of respiration upon calves, sheep, hogs, and turkeys, found that, in a close stable, having a capacity of 133½ cubic meters, and containing 50 sheep, the air, after one hour and ten minutes, contained one per cent., and after twelve hours, 10 per cent. of carbonic acid; so that, if the respiration could have continued in this proportion, the whole of the oxygen would have been converted into carbonic acid in 25 hours.

Dr. E. Smith, (Proceedings Royal Soc., ix, 611, 638,) in his "Inquiries into the Phenomena of Respiration," observed the quantity of air inspired, and of carbonic acid expired, together with the rate of pulsation and respiration, noting—1st. The phenomena during the 24 hours with and without exertion and food. 2d. The variations from day to day and for the season. 3d. The influences of particular kinds of exertion.

The experiments were performed upon himself and upon three other persons; the results are stated in weight. The quantity of carbonic acid expired in 24 hours varied from 24.274 ounces to 16.43. In a light sleep it was from 4.88 to 4.99 grains per minute, and the total evolution in the six hours of the night was 1,950 grains. The quantity of air inspired varied from 583 to 365 cubic inches per minute, the depth of inspiration being from 30 to 39.5 cubic inches. The respirations were, to the pulsations, as 1 to 4.63 in the youngest, and as 1 to 5.72 in the oldest.

One-half of the product of the respirations into the pulsations gave nearly the cubic inches of air inspired by some of the persons.

The proportion of the carbonic acid to the air inspired varied from 1 : 54.7 cubic inches to 1 : 58.

The variations of the carbonic acid evolved during the working day yielded an average maximum of 10.43 and a minimum of 6.74 grains per minute. This quantity increased after a meal, and decreased from each meal, so that the minima were nearly the same, and the maxima were the greatest after breakfast and tea.

The hot season caused a diminution of all the respiratory phenomena. The maxima were in spring, and the minima toward the close of summer, with periods of decrease in June and of increase in October.

In the author the diminution amounted to—

In the quantity of air	30 per cent.
In the rate of respiration	32 per cent.
In the quantity of carbonic acid	17 per cent.

The maximum influence of the food upon the respiration was observed to be effective within two and a half hours after its reception.

III. ON THE DIRECTION THE PRODUCTS OF RESPIRATION TAKE AFTER LEAVING THE BODY.

It does not enter within the scope of this report to pronounce an opinion upon the different methods of ventilation. Having tested it and approved its efficiency, I am absolved from the responsibility of advising the adoption of any different plan from that which exists in the Capitol. Before this conclusion was reached through the experiments, I made the following observations upon the course of the breath after it leaves the body:

Mr. Goldsworthy Gurney, in his testimony before a committee of the House of Commons, asserts that the breath is forced downward through the nostrils *to the ground*, which is the natural provision against breathing the same air over again. He proves

the fact by tracing the downward course of the current by the condensation of the breath of the nostrils on a frosty day. This opinion is quoted by those authors who approve of the downward system of ventilation, and it is given, also, in an admirable treatise upon the elements of ventilation, contained in a report by Messrs. Shedd & Edson to a committee of the Massachusetts legislature.

The conditions are different for a person in the external air and when in a room raised to a comfortable temperature. In the former case the breath, nearly saturated with moisture from the temperature of the body, parts with a large portion of its water by the action of the hygrometric condition of the cold external air. These particles of water thus produced are specifically heavier than air, and their tendency to fall is assisted by the downward impulse from the nostrils.

The experiment, to be fair, should be performed in the room, and at the temperature concerning which the practical conclusions are drawn. On March 27, 1865, at 1½ p. m., in the laboratory of the Smithsonian Institution, the temperature of which was 69°.26 Fahrenheit, a delicate thermometer, held in the hand for several minutes, indicated 95°.36 Fahrenheit. Held in the same mouth, and observing the degree by the aid of a mirror, it indicated the same temperature. Upon smoking a pipe with a stem of wood six inches long, slowly, with the thermometer also in the mouth, the temperature did not sensibly rise. Having thus obviated a source of error from any supposed heat in the tobacco-smoke, I experimented upon the air currents of the breath, both while sitting and standing, following them readily by aid of the smoke.

Before expulsion the smoke was held in the mouth for a short time to insure its temperature to be the same as that of the breath, and the hot pipe was held or placed aside. When the smoke is expelled gently from the nostrils, as in the act of breathing, it proceeds downward for a foot or less, and then rises rapidly. It rises more rapidly when in the sitting posture by reason of the current of warm air ascending from the legs.

When the smoke is blown with great force through a glass tube, it can be made to reach the ground, but the tendency after it loses its momentum is still upward. Blown horizontally, it rises as soon as the horizontal force is exhausted, which depends upon the force of the blast. The smoke blown upward through the glass tube rises very rapidly, as may be seen also by the rings of smoke which some persons delight to produce.

After the experiment the smoke hangs about the ceiling, disappearing gradually.

These experiments, which any one may repeat, appear to settle the question of the upward tendency of the breath if any proof be needed.

IV. THE MOISTURE IN THE AIR.

I. GENERAL CONSIDERATIONS.

For an atmosphere which shall be salubrious to the inmates of an apartment, the hygrometric condition of the air is as important as its freedom from poisonous or deleterious gases. The experiments have shown the air of the Capitol to be as deficient in this respect as it is excellent in regard to the degree of ventilation afforded. In fact, the deficiency of aqueous vapor is, in a measure, due to the abundance of the ventilation, for the dry air of winter, having its capacity for moisture increased by warmth, is forced through the halls with such liberality as to carry off not only the carbonic acid, but also the water arising from respiration.

The evaporation of water from the body is intimately connected with health. The sudoriparous glands, which are constantly secreting their liquid, have a length of tubing which has been estimated at twenty-eight miles. The secretion takes place so gradually that the water ordinarily evaporates as insensible perspiration as soon as it reaches the exterior surface of the skin.

During severe exercise, exposure to great heat, in some diseases, or when the evaporation is hindered by an impermeable covering, the secretion collects upon the exterior of the body in drops of sensible perspiration.

The total average loss by the lungs and skin in twenty-four hours is almost 3½ pounds of water, of which somewhat more than $\frac{3}{5}$, say 2½ pounds, are furnished by the skin. Of these 2½ pounds, only $\frac{1}{6}$ is furnished by the vital process of secretion, by the sweat glands, for the greater part of the moisture transudes through the skin by simple evaporation. The cutaneous and urinary excretions are, as is well known, vicarious. The evaporation from the skin regulates the animal heat, the body being in an analogous condition to those porous earthen jars in which the inhabitants of tropical climates cool water by the evaporation of that portion which exudes to the surface of the vessel.

The estimated loss of heat to the body by evaporation, per minute, is sufficient to raise a half a pint of water from the freezing to the boiling temperature.

For health the body must evaporate a quantity of water within certain limits. The amount evaporated is influenced by the hygrometric condition of the air and by the state of the body itself. The evaporation is increased by muscular action and by a dry atmosphere; it is diminished by repose and by a moist air.

If the functions of the skin are interrupted, certain diseases are manifested. Among these are affections of the throat, catarrh—passing into acute bronchitis—pulmonary consumption, pericarditis, inflammation of the stomach and bowels, dyspepsia, rheumatism, gout, and fevers.

"In the climate, or we might say rather climates, of the United States, every possible means ought to be enlisted for enabling the inhabitants to bear up under the two extremes, constituting two contrasted climates, of great summer heat and great winter cold. The influence of one is so powerful and sufficiently prolonged as to render us susceptible invariably to the other; and we, in the Middle States, are nearly in the situation of those who should spend their summers in Egypt and their winters in Russia."*

Our country has a different climate, in respect to moisture, from those parts of Europe which have the same temperature.

Desor (Du Climat des États-Unis et de ses effets sur les habitudes et les mœurs. Actes de la Soc. Helvet. des Sc. Nat., 1853) has endeavored to show the influence of our dry climate upon the manners and customs of our people, and the difference in this respect as it appears to an European.

"The German immigrant finds that the wash dries faster; the bread which at home could be preserved for several weeks, becomes useless in a few days; the crops are more uncertain; the cabinet-makers find that their wood, which, according to the experience of the old country, was deemed sufficiently dry to be made up into furniture, warps, in Boston and New York, in a short time; further, that they must employ stronger glue in America."

Desor supposés that the influence of our comparatively dry climate stamps its impress upon the people; thus "the North Americans are, for the most part, spare, and with long necks. Europeans, in America, become speedily more lean, and Americans, in Europe, more fleshy. The European who arrives in New York, Boston, or Baltimore, is surprised at the feverish activity everywhere prevailing. Everybody is in a hurry, and the persons on the street run rather than walk. In some of the larger cities of England a similar condition is apparent; but the activity of the Englishman appears more deliberate; that of the Yankee more instinctive, and rather the result of a natural impatience than from necessity. The Americans, even with leisure, scarce take time to eat their meals. In spite of their apparent coldness, they are more excitable than the Europeans, and their sensibility is proverbial."

Whatever may be the climatic difference between Europe and America, and its physiological effect upon the people, every one has felt the oppression produced by a low dew-point, and the relief experienced upon the advent of a shower, or by an approach to the ocean or to a lake.

The moisture in the atmosphere may be regarded from two points of view; 1st. As to the absolute quantity present at any time, and for any temperature. 2d. The relation which it bears to a saturation of the air, at the same temperature, with watery vapor.

1st. The absolute amount of water (such as grains in a cubic foot of air) is measured by the depression which it exerts, by making the air specifically lighter, upon the barometric column, and which, in consequence, is taken as its measure. This quantity increases with the temperature, and is greater in summer than in winter.

2d. The relative humidity is expressed in percentages of the saturation of the air for moisture at any given temperature. The warmer the air the greater is its capacity for containing watery vapor. If, therefore, we warm a cubic foot of air which is saturated with moisture, that is, which has a relative humidity = 100, we may attain a relative humidity of, say, 50, or of any number below 100; and, *vice versa*, air posessing a relative humidity of 50 may attain that of 100 by being cooled to the proper degree. The relative humidity is greatest, that is, the air is nearest its point of saturation, in winter, although the absolute quantity of water it contains is then least.

---

* Dr. John Bell. Treatise on Baths.

The following table of the mean proportion of aqueous vapor in the air of Halle, Germany, will illustrate these principles:

Months.	Tension, in millimeters, of the aqueous vapor, measuring the absolute humidity.	Relative humidity.
January	4.509	85.0
February	4.749	79.9
March	5.107	76.4
April	6.247	71.4
May	7.836	69.1
June	10.843	69.7
July	11.626	66.5
August	10.701	61.0
September	9.560	72.8
October	7.868	78.9
November	5.644	85.3
December	5.599	86.2

Thus, as the tension or absolute humidity increases with the year, the relative humidity decreases.

The following table* expresses, in troy grains, the weight of vapor contained in a cubic foot of saturated air at temperatures of Fahrenheit:

Temperature of air.	Vapor, in grains.	Temperature of air.	Vapor, in grains.	Temperature of air.	Vapor, in grains.
°		°		°	
0	0.545	63	6.361	80	10.949
5	0.678	64	6.575	81	11.291
10	0.841	65	6.795	82	11.643
20	1.298	66	7.021	83	12.005
30	1.968	67	7.253	84	12.376
32	2.126	68	7.493	85	12.756
40	2.862	69	7.739	86	13.146
45	3.426	70	7.992	87	13.546
50	4.089	71	8.252	88	13.957
55	4.860	72	8.521	89	14.378
56	5.028	73	8.797	90	14.810
57	5.202	74	9.081	91	15.254
58	5.381	75	9.372	92	15.709
59	5.566	76	9.670	93	16.176
60	5.756	77	9.977	94	16.654
61	5.952	78	10.292	95	17.145
62	6.154	79	10.616	96	17.648

The relative humidity of the air very frequently reaches 100. Very rarely does it fall to 0. Nor is this 0 of observations absolute dryness of the air, but such a degree of it as to be outside of the limits of the tables which have been calculated for the reduction of psychrometrical observations. There are, however, records of extremely dry conditions of the atmosphere (Müller Lehrbuch der Kosmischen Physik, p. 404) in certain places.

1. Thus Humboldt and G. Rosé found on the steppes of Platowskaya air with a temperature of 74°.66 Fahrenheit, and a difference between the dry and wet bulbs of the thermometer of 21°.06. This condition of dryness corresponds to less than 1.967 grains

*Guyot, No. X. Smithsonian Meteorological tables.

of moisture in a cubic foot of air; and since this quantity of water would saturate air of the temperature of 30° Fahrenheit, it follows that the dew-point of the air observed must have been below 30° Fahrenheit. The relative humidity is 15.

2. Abbadie observed at Abbay, upon the Blue Nile, the dry bulb, 98°.70; the wet bulb, 67°.82; difference, 30°.96. This corresponds to 2.662 grains of moisture in the air, which was capable, from the temperature, of holding 18.75 grains; or to a relative humidity of 1.4, and to a dew-point of 38° Fahrenheit.*

3. The same observer found air upon the coast of the Red Sea during a simoon communicating to the dry bulb a temperature of 108°.86; wet bulb, 69°.08; difference, 39°:78. A cubic foot of the air was capable of holding 18.66 grains of moisture, but contained only 1.66 grains. It had, consequently, a relative humidity of 0.9, and a dew-point of 26° Fahrenheit.*

Such a degree of dryness is very unusual, and is much greater than that occasionally observed, and which is indicated by a relative humidity of 0 in meteorological reports, because the tables do not extend to the calculation of such low humidities.

Character of the air of the Mammoth Cave.—The following observations, made during a visit to the Mammoth Cave of Kentucky in the year 1855, and which are now for the first time published, have a bearing upon the temperature and hygrometric condition of an agreeable and bracing atmosphere. During the afternoon of July 17 the short route was accomplished, which embraces the points of interest not very remote from the entrance to the cave. The temperature of the external air was at 82° Fahrenheit.

During the summer season, as is well known, a current of air, which at the door of entrance is so strong that the flame of a candle is kept alight with difficulty, issues from the cave. In the winter season this current is reversed, thus exhibiting a ventilation due to the heating effect of the sun upon the earth.

In the draught of air which issued from the mouth of the cave and at a distance of about one hundred feet from the door, the thermometer stood at 72°. At the dripping spring and trough inside of the cave, the temperature was 66°. At the first saltpeter vat it was 60°, and at a short distance beyond this point it was 59°. Thus, as the visitor enters the cave, he becomes accustomed to the gradually falling temperature, and no shock is experienced in passing from an atmosphere of 82° to one of 58°. At the second saltpeter vat the dry bulb indicated 58°, and the wet one 56°, corresponding to a relative humidity of 87.6, according to Guyot's tables. The temperature of the small spring called Lake Purity was 55°. The temperature and relative humidity of all parts of the cave visited at this time were, respectively, 58° and 87.6, with the exception of the Star Chamber, which is situated near the houses built for the residences of consumptives. Here the temperature of the air was 59°, and that of the wet bulb was 55°, agreeing to a relative humidity of 76.1.

On July 18 the long route was taken in the company of a friend and with an intelligent guide. We entered the cave at 8½ a. m., and left it at ten minutes before 5 p. m. The distance traveled was estimated by the guide at eighteen miles, and although upon our feet constantly, with the exception of a short rest at dinner time, and with a delay sufficient for a bath in Lake Lethé, and sometimes using considerable exertion, we did not experience great fatigue. The temperature of the external air was 82°. In the cave from Echo River to Martha's Vineyard the mercury stood almost constantly at 58°; but in two or three instances 60° was indicated, and upon one occasion the temperature was 57°. The temperature of the water of Hebe's Spring was 56°. From Martha's Vineyard to Cleveland's Cabinet the thermometer indicated 58°. In the end of the cave, at 12*h*. 35*m*. p. m., the dry bulb stood at 58°, and the wet one at 56°, corresponding to a relative humidity of 87.6. In Washington Hall, at 2 p. m., after our dinner, the dry bulb equaled 57°; the wet bulb 56°, or relative humidity 93.6, by one observation. At 4 p. m., on the shore of Lake Lethé, dry bulb, 58; wet bulb, 56°= relative humidity, 87.6. We caught, in the above lake, two fishes and a craw-fish, without eyes, and in the end of the cave a cricket and several other insects having eyes. The proprietor would not permit a survey of the cave to be made, as it was supposed that another entrance existed upon the property of some other person, and of which rumor indicated the situation in or near the end of the cave. The insects with eyes found at this point appear to confirm this view. Such an opening in the cave would seem to be necessary to effect its ventilation. No currents of air were perceptible to the senses inside of the cave, nor was any carbonic acid discovered at the bottom of the deep pits, which were tested by throwing lighted papers into them. This cave presents the example of a bracing and salubrious atmosphere in the summer season, which qualities appear to be due, first, to its lower temperature of 58°, and, secondly, to its suitable proportion of moisture, which corresponds to a relative humidity of 87.6. The fact of its bracing property is abundantly shown by the experience of the numerous visitors, many of whom are delicate women, who make the excursion of the long route in a single day without suffering greater fatigue than a few hours of similar labor in the external air would produce.

---

*By Guyot's tables.

The houses built for the consumptive patients were located in the dryest portion of the cave, where the temperature of the air was slightly higher, (one degree,) and its relative humidity 76.1, or less than in the remaining localities visited by me. The failure of the beneficial effects upon the sick, which were expected from a residence of consumptive patients in the houses built in the cave, arose not from the character or quality of the air, but from the need for sunlight, the effect of which was especially severe upon constitutions debilitated by disease.

An atmosphere of 58°, and a relative humidity of 87½, although most agreeable for exertion in the summer time, would scarcely answer for a legislative hall, were it even readily to be attained. During the warm weather a few degrees less than the temperature of the external air would prove pleasant, and the fall of temperature at that season would yield a greater relative humidity. In the winter season, in such a hall, the production of a summer atmosphere without the moisture proper to that season can only give rise to sensations of discomfort and provoke disease. The relative humidity found in the Mammoth Cave corresponds in amount to what has been, from other considerations, shown to be the most agreeable.

The rapidity of the evaporation of the body depends *principally* upon the low relative humidity of the air at a high temperature, and upon the maintenance of this condition in the neighborhood of the body by the action of currents of air. Thus, with too great dryness of the air, particularly at the elevated temperature, and especially if it pass rapidly over the body, there will be a greater degree of evaporation than is consistent with health. On the other hand, in an atmosphere saturated with moisture, the evaporation from the body would be reduced to a minimum, and would be practically nothing in such air having the same temperature as the body. Although we may bear with impunity these extremes for a short period, a persistence in such conditions would be fraught with danger.

In the external air of winter the body cools more rapidly than in summer from the difference of temperature. We regulate the expenditure of animal heat by our clothing, and in summer we do not consume in our bodies as much or as heating fuel, in the shape of food, as in winter. The winter air, though *relatively* moist, is *dryer* than the summer atmosphere in respect to the weight of vapor dissolved in a cubic foot of air. If, therefore, we raise this cold air, as in our dwellings, to the temperature of summer, thereby increasing its capacity for moisture, a much dryer air than that of summer is the result if we do not at the same time add water to it. In an ordinary dwelling-room, with the low degree of ventilation which is sufficient for a few persons, and with a stove or grate in the apartment communicating a different degree of heat to different parts of the room, the desiccating effects alluded to are not so perceptible. The inmates select naturally that part of the room which is comfortable to them, and the moisture arising from respiration is not, to a great extent, withdrawn from the room, but is extended to all parts rapidly by diffusion. When a large volume of dry air is introduced by means of a hot-air furnace, (especially if without the addition of water,) the products of respiration being rapidly carried away, and the temperature of the room becoming uniform, so as to deprive its inmates of the advantages of selecting that most comfortable to each, the effects of the rapid evaporation from the body are apparent in the complaints that the "air is *burned*."

Heating the air to a considerable degree cannot injure it for vital purposes, unless by depriving it of ozone, which is oxygen gas in a peculiar condition. There is, however, but little, if any, ozone in the air of dwellings; its function in the atmosphere is unknown to us, but appears to be that of destroying the poison of miasms. The combustion of the animalcules, dust &c., in the air would give the same products of dry distillation as other animal and vegetable substances, a portion of which would be carbonic acid, which would be so small in amount that it would almost escape the most careful observer. In the method of organic analysis by Hess, where a considerable quantity of air is drawn through the combustion tube, the carbonic acid is not found to be greater than by other systems of analysis; and the most delicate experiments have been needed lately to exhibit the reactions of carbonic acid arising from the combustion of the organic matter in the air. As regards the destruction of contagious matters supposed to exist sometimes in the atmosphere, the heating would, by destroying them, produce a decidedly beneficial effect. There is no need of forming improbable hypotheses to account for the insalubrity of a dry, hot furnace air.

The following example will serve to illustrate the hygrometric condition of the external air of winter:

At the Savage mine of Virginia City, when the external air is cold, a large volume, apparently of steam, issues from the mouth of the mine, condensing upon and covering the neighboring objects with water. This phenomenon occurs only in certain conditions of the atmosphere, as when the dew-point is rather high the cold air descends the ventilating shaft, and is warmed and saturated with moisture at that temperature by the earth. When it issues into the cold and nearly saturated air it must part with the moisture with which it is surcharged for a lower temperature, giving rise to clouds of steam.

If we desire a summer atmosphere in our winter dwellings we should give to it the mean relative humidity of the external air, or rather the mean relative humidity of the summer months, since it is probable that the annual mean does not fairly express the relative dryness of different countries, the winter humidity being nearly the same in all places. In other words, we should adopt the standard which nature extends to us.

Müller (Kosmische Physik) gives the annual mean relative humidity at 75.

Roscoe states that the experience in heating the House of Lords shows that an agreeable atmosphere, as regards aqueous vapor, is found to exist when the relative moisture ranges from 55 to 82; mean, 68½.

The following tables give the relative humidity for Washington City and for Philadelphia. The first table contains the lowest relative humidity and the means for the months of January and June, for the whole year,* and for the series of years. The mean for the series of years is calculated with and also without 1855, which appears to have been a very dry year. The second table gives the results of January, June, the year, and the seasons of the year 1863 in Philadelphia, a city of proverbial salubrity. There is also the general mean of twelve years' observations.

From these observations the mean annual relative humidity of Philadelphia is 68.5; that of Washington is 68.2; but the observations are not for so long a period as for Philadelphia. From these results it would be safe to adopt a relative humidity for the halls of Congress of from 60 to 80, which have a mean of 70°.

In the third table may be found the results of the experiments upon the relative humidity of the Capitol extension.

I have given in them the relations of a cubic foot of air to the moisture—

1st. As to the number of grains of water which it *can* contain in the respective experiments; 2d, what it does contain; and, 3d, the deficiency of water in a cubic foot of air, in the respective experiments, for a relative humidity of 70.

In the last column I have extended the calculation to ascertain the number of pounds of water required to give to 60,000 cubic feet of the air per minute a relative humidity of 70.

Temp. of external air 59°, rel. h. 72.

* That is, for air of a temperature of 29°.8 Fahrenheit, or a temperature of 70°, the air would require more in proportion to its expansion.

† The ventilation for the Senate is 30,000 cubic feet of air per minute.

II. EXPERIMENTS UPON THE HUMIDITY OF THE CAPITOL EXTENSION

Embrace a series of ninety-two observations made in the summer and in the winter. Those of the summer, Nos. 1 to 34, inclusive, illustrate admirably the condition of the air furnished by the ventilating apparatus at that season.

The summer experiments.—On June 27, 1864, after a prolonged dry period, the temperature of the air at an open window of the Smithsonian laboratory, at noon, was 90°.5 Fahrenheit. At 2 p. m. a storm was approaching, and the air had a temperature of 86°.9. The relative humidity had increased from 47 to 51. During the experiments in the Senate chamber the storm burst upon us, but was of short duration. The relative humidity in the chamber rose, and the temperature fell with the storm; the former was at its maximum (Ex. 4) at 77, and the temperature reached its minimum at 82°.4. At the commencement of the observations it would have taken twenty-seven pounds of water per minute to have given to the air of the Senate chamber the maximum relative humidity for comfort, viz, 70. The necessity for water was entirely obviated at the time of Experiment No. 4, and when the examination was completed the humidity was within the mean amount for health. I watched the condition of the Senators while the relative humidity was increasing, and although it was not very low in the commencement, as it had been gradually increasing all the morning, I could not fail to observe their expressions of relief and comfort (in which I shared) at the changed hygrometric state of the atmosphere, the temperature having at the same time fallen 3°.6 Fahrenheit.

On July 2 (Ex. 23–34) there was another storm which commenced before I reached the Senate. Before the storm the temperature of the air at a window of the laboratory was 88°.2, its relative humidity 51. As the storm was ceasing, at the same place, the temperature was 78°.8, the relative humidity 80. At 3 p. m. the external air at the Capitol was 84°.2, and the relative humidity 71. The temperature and humidity were the same in the chamber as in the external air; but at the registers, through which the fresh air entered the Senate chamber, the temperature was slightly lower, and the humidity a little higher.* This air was very comfortable.

On June 30 (Ex. 16-22) the air of the Representatives' hall was examined under the disturbing influence of a storm, which gave a sufficient relative humidity to the atmosphere.

On June 28 and 29 (Ex. 6–15) the air of the Senate chamber was examined during clear weather, the temperature of the air being high, but not excessive for summer. The temperature and humidity in the chamber and in the external air were nearly alike, and the humidity was very low.

A jet of water in one of the air-ducts during these summer observations cooled the air in the duct from one to two degrees, but did not suffice to lower the temperature of the apartment below that of the external air.

It will be observed from Table 1 that the mean relative humidity at Washington at 2 p. m., for 5 years, in June, is 57.4, and that the minimum has fallen as low as 22. The summer experiments show that the air of the legislative halls may be made cooler and more pleasantly moist in the summer by the judicious and *sufficient* evaporation of water. It must be sufficient to produce the desired effect. It must be employed with judgment, and *not added* when the air has a high relative humidity, for in such a case it would communicate too much moisture, and might even introduce a portion in the form of mist, to be deposited upon the walls. For example, with the temperature (Ex. 1) at 90°.5, the evaporation of twenty-nine pounds of water per minute would raise the humidity to its healthful maximum *at that temperature;* so much, indeed, would not be needed, for this evaporation would occasion a fall of the temperature several degrees.

It is evident that the evaporation of any more water at the time of Experiment 4 would be hurtful. To add water, whether in winter or summer, requires *intelligent and watchful industry,* aided by a proper psychrometer. Fortunately the latter desideratum has been supplied by an invention of Mr. William Edson, who has contrived a hygrometer which gives at any time the dew-point and relative humidity by a mechanical arrangement, obviating a recourse to tables or calculations.

An objection has been made to the heating action in summer of the terrace from which the air is drawn. The experiments have not given any indication of such heating action, nor was it to be expected. The warm pavement radiates its heat into space, and does not raise the temperature of the air upon it to any considerable extent. This may be *seen* by looking over a similar heated surface toward the sky. The hot air may be perceived by its tremulous motion, which arises from the different refrangibility for the rays of light of the unequally heated strata of air. It will be noticed that this elevation of temperature does not extend more than a few feet above the ground. I have not found the terrace, nor the short vertical shafts by which the air enters the fan-room, in a clean condition. They ought to be maintained scrupulously neat, and in the summer time should be washed off with the hose at least once daily.

---

* There was a small jet of water in the air-duct.

The winter experiments are very interesting, and indicate the cause of the complaints which some have made as to the ventilation. They demonstrate that the difficulty lies in a deficiency of moisture in the air. The "*absolute*" dryness of the air in winter is great, and its "*relative*" dryness is vastly increased after it has been raised to the temperature requisite for heating the halls. It will not be necessary to take up the results *seriatim* to prove this. A glance at the table will show how low the degree of relative humidity is. Even when, as in Ex. 56–61, the relative humidity of the external air is 100, that of the halls is below the healthy minimum; and at times the moisture falls to 20. The mean relative humidity at 2 p. m., for the external air of the five Januaries of Table 1, is 67.

The remedy for this defect consists in adding to the air of the halls from sixteen to thirty-five pounds of water per minute for a ventilation of 60,000 cubic feet of air per minute.

This moisture must, as was said for the summer experiments, be added intelligently. Too much water would be as injurious as too little.

A sufficiency of moisture would enable a somewhat lower temperature to be maintained in the halls. The moisture might be added by the cautious injection of steam. A commission of scientific men (Peclet's nouveaux documens) proposed to maintain the air of the Hospital du Nord at a relative humidity of 50 by the addition of steam. Some of the heating coils in the Capitol extension were originally provided with steam-cocks for the same purpose. I think that the rapidity of the current in the present air-ducts would render a sufficient hydration of the air, without carrying the water into the halls in the form of mist, impossible. To effect this object, therefore, would require a much larger chamber in which the air-current could pass with diminished velocity and be mingled with steam* in the winter time, and with water in the summer. The jet of water in the air-duct, in the experiments of last summer, was insufficient and did not cause a perceptible increase of the relative humidity of the halls.

The following experiment, performed on February 23 to 27, gave a similar result:

An iron pan, of 60 square feet in surface, was filled with water and placed in the (heated) main air-duct of the House of Representatives. The water was warmed by steam-pipes. With an average steam pressure of 24 pounds, and a temperature of the water equal to 172° Fahrenheit, 74.8 gallons of water were evaporated in five hours, which is equal to 14.96 gallons† per hour and 0.25 gallon = 2.08 pounds per minute. The moisture in the hall was determined upon February 25, with the evaporator in action, and again upon February 27, the heat having been excluded from the evaporator from the afternoon of February 25. As, by an oversight, the *water* remained in the tank, the experiment was less decided than it would otherwise have been, since the current of dry, warm air must have taken up water in the experiment of February 27.

To ascertain the effect of this evaporation it will be necessary to calculate the amount of water which the air of the halls receives from the atmosphere and from other sources.

In this calculation I have neglected the barometric pressure, which did not vary much from its normal, and also the change of volume of the air due to the tension of aqueous vapor, which will not influence the results materially.

I have used $\frac{1}{460}$ as the expansion of air per Fah. degree from 0° Fah. In Experiments 46 and 49 a cubic foot of the external air contains 1.11 grains of water at 30°.6 Fah., and by expanding to 70.9° (the temperature of the Senate chamber) a cubic foot would contain 1.03 grains of moisture; but the air of the Senate contains 1.65 grains; hence 0.62 grains of water have been added to it by the breath of the audience, by the absorption of water from the ground through the air-duct, and from other sources. Since a thousand men would exhale 12,000 grains of water per minute, they would introduce into the 60,000 cubic feet of air furnished by the fan per minute 0.2 grains of moisture per foot, which leaves 0.42 grains to be attributed to other sources than the exhalation of the audience.

In Experiments 74 and 75, upon the moisture of the external and internal air at the House of Representatives, with the evaporator in action, out of the 3.33 grains of water per cubic foot of air of the hall, 2.21 are present from the external air and 1.12 grains have been added from other sources. If the same conditions exist as in Experiments 46 and 49, 0.62 grains of water have been furnished by the breath, &c., and 0.5 grains by the action of the evaporator.

In Experiments 79 and 80, in the House of Representatives, the evaporators being filled with *cold* water, in a cubic foot of air, out of the 3.11 grains of water present, 2.02 are due to the moisture of the external air and 1.09 grains to the action of the hot air over the water, to the breath, and to other sources; hence 1.09 — 0.62 = 0.47 are due to the *cold* evaporator. The difference between these two experiments is 0.03 grains of water per cubic foot. If we compare the experiments of the House of Representatives alone we have for the evaporator, with heat, 1.12 grains; without heat, 1.09 grains;

Vide Antozone, p. 92.

† According to the observation of the engineer, Mr. Jacob D. Forney.

difference, 0.04 grains per cubic foot of air. As the influence of *heat* upon the evaporation of water in the tank is very considerable, it appears that the benefit to the hydration from the evaporator is very small.

For a ventilation of 60,000 cubic feet per minute, in Experiment 49 in the Senate, 35.2 pounds of water per minute are required to effect a relative humidity of 70, or half that quantity for a ventilation of 30,000 cubic feet.

In Experiments 75 and 80, in the House of Representatives, this quantity of water amounted to 17.9 pounds with the active evaporator, and to 23.8 pounds without it.

It is certain that the hydration of the air will involve, in the winter, a considerable expenditure of fuel for a powerful ventilation; but the hydration is as necessary to health and comfort as the warmth.

The following is an approximate calculation of the amount of coal needed to yield to the air of the Senate a relative humidity of 70, based upon the data of Experiments 51 and 52:

Mr. Joseph Nason (Ex. Doc. No. 20, 36th Cong., 1st session, p. 10) estimates, upon the assumption that 1 pound of coal will evaporate 7½ pounds of water, that 7.33 tons of coal will be required per day, of 24 hours, to produce an agreeable temperature in the hall of Representatives, with a ventilation of 50,000 cubic feet of air per minute. In the Senate, for a ventilation of 30,000 cubic feet, according to the same calculation, 4.06 tons of coal would be required for 24 hours. By Experiment 51, 31.5 pounds of water per minute would be needed to communicate a relative moisture of 70 to 60,000 cubic feet of air per minute, or 15.75 pounds for a ventilation of 30,000 cubic feet. This quantity of water would require 2.1 pounds of coal per minute, or 1.35 ton per 24 hours. But the air required 4.06 tons for heating it, which numbers are in the proportion of 1 to 3.

The best ventilation and hydration cannot suit every individual. In an audience some will need more moisture, and some less heat, than others, and a mean, adapted to the wants of the majority, must be maintained. It is somewhat with warming and ventilation as with civilized society—a portion of individual comfort must be resigned to secure the benefits of civilization to the community.

V. MISCELLANEOUS SUBSTANCES IN THE ATMOSPHERE.

In addition to the principal constituents of the atmosphere which have been treated in this report, there are others which exist in minute proportion, but which, doubtless, have a decided influence upon health.

Müilder observed that a flame of hydrogen gas, burning in breath from the lungs, did not exhibit in the spectroscope the reaction of sodium, although the air, before breathing, gave the same in a decided manner; and he infers that the lungs act as a filter for the small quantity of chloride of sodium floating in the air. May not other solids or gases, supposed to be innocuous, be thus absorbed to the detriment of our health? The following is a brief account of some of these constituents of the atmosphere:

I. AMMONIA.

Ammonia is always contained, in small proportion, in the air, and has been supposed by Liebig and others to perform an important function in vegetation.

Horsford, (Am. Asso. for Advancement of Science, 1849, p. 124,) in an examination of the atmosphere for this constituent, obtained, as a result of experiments, from 1.2 to 47.6 parts of ammonia in one million parts of air, the alkali being in larger proportion in July and least in December. No difference in the amount was detected in the air collected on the sea-coast during an east wind compared with the air of a densely-populated locality in Boston.

Pierre (Liebig and Kopp, Jahresbricht v, p. 356) gives, as the result of four months' observation in the winter at Caen, 3½ millionths of ammonia, by weight, in the atmosphere. The same chemist, by a subsequent (Comptes Rendus, xxxvi, 694) examination of the air for nine months, at the same locality, found ¼ of a millionth part of ammonia.

Bineau, (Ann. de Ch. et de Phys., [3] xlii, 462,) in a series of experiments performed at Lyons and at Caluire, in the neighborhood, during 1852–'3, found that at the former place the mean annual amount of ammonia in the air was between ¼ and ⅓ of a millionth, while in Caluire it was in winter 40 and in the summer 80 billionths in weight.

The following proportion by volume of ammonia in one million *volumes* of air have been given by different observers: Graeger investigated the air of Alsace; Kemp, that of Ireland, during two summer days, at an elevation of 300 feet above the sea level; and Fresenius at Wiesbaden, Germany, during forty days of changeable weather.

Table of volumes of ammonia in one million volumes of air.

Observer.	Ammonia, NH_3.	Oxide of ammonium, NH_4O.	Carbonate of ammonia, $NH_4O\ CO_2$.
Graeger	0.333	0.508	0.938
Kemp	3.880	5.610	10.370
Fresenius, day	0.098	0.153	0.283
Fresenius, night	0.169	0.257	0.474
Fresenius, mean	0.133	0.205	0.379

The ammonia in the first column is *equivalent* to so much oxide of ammonium and carbonate of ammonia as stated in the second and third columns.

II. ACIDS IN THE AIR.

Dr. R. Angus Smith (Qr. Jour. Chemical Society, xi, p. 209) observed at the sea-side (Blackpool) a slight degree of acidity in the air, since blue litmus paper had its color somewhat diminished by exposure over night to the air; but in Manchester the reagent became red in half an hour, and sometimes in ten minutes.

The same chemist examined the smoke from chimneys, and found in 100 cubic feet (reduced to 65° Fahrenheit) the following amount of acid in grains:

Specimens of smoke.	Sulphurous acid.	Equivalent to hydrate of sulphuric acid.
1	16.260	24.050
2	23.850	36.522
3	5.322	8.150
4	5.271	8.072
Mean	12.651	19.199

From a determination of the sulphur in coal, and from the analysis of rain for its acid, Dr. Smith makes the following calculations:

Sulphur, equal to one per cent. of the coal burned in Manchester, would give an amount of 61,245 tons of sulphuric acid per year. Over an area of 16 miles, and with a rain-fall three feet deep, one thousand tons of sulphuric acid fall with the rain in a year, which is only about 1.588 per cent. of the quantity produced. Dr. Thompson always found in the air of London sufficient sulphuric acid to give an acid reaction to water through which it was passed. These acids (sulphurous and sulphuric) are always found in the air of towns where coal is burned, and are not considered injurious, but rather beneficial, as tending to arrest putrefaction.*

III. ORGANIC MATTER IN THE AIR.

Dr. Thompson (Appendix to Report of the Committee for Scientific Inquiry in Relation to the Cholera Epidemic of 1854, p. 110, London) appears to have first recognized the importance of organic matter as a constituent of the air of towns. He found that the air of London, when passed through oil of vitriol, communicated a dark tinge to it, and if large quantities of air were passed through distilled water the inevitable result was the formation of fungi.

Dr. R. Angus Smith (Op. Cit., p. 217) tested the air for organic matter by ascertaining the amount of air necessary to discharge the color of a solution of permanganate of potash, of which the strength was obtained by decomposing a known weight of sugar or of oxalic acid. Supposing the sugar and the organic matter in the air to be decomposed by exactly the same amount of permanganate, which will not involve a great error, he obtained the proportion of organic matter existing in the air.

* Thompson.

The following table of his results is taken from the Chemical Gazette of 1859, p. 176:

	Grains of organic matter in 100 cubic inches of air.
Manchester, 131 experiments	52.9
Manchester, All Saints, east wind, 37 experiments	52.4
Manchester, All Saints, west wind, less smoky	49.1
Manchester, All Saints, east wind, 16 experiments, above 70° Fahrenheit	58.4
Manchester, All Saints, east wind, 21 experiments, below 70°	48.0
Manchester, in a house kept rather close	60.7
In a pig-sty, uncovered	109.7
Thames, at city, after warmest weather of 1858—no odor perceived	58.4
Thames, Lambeth	43.2
Thames, Waterloo bridge	43.2
London, 6 experiments during warm weather	29.2
In the fields south of Manchester	13.7
In the fields north of Highgate—wind from London	12.3
North Italy—warm weather in the fields	6.6
Near Milan—moist fields	18.1
London, after a thunder-storm	12.3
German Ocean—calm, 60 miles from Yarmouth	3.3
Hospice Mt. St. Bernard—fog	2.8
North Lancashire	2.8
Forest at Chamounix	2.8
Lake Lucerne	1.4

Hoffmann proposes the use of the permanganate of potassa for the purification of the air. Dr. Smith, repeating the experiment of passing ozonized air through blood, confirmed the fact of a decided and remarkable reddening. He thought that he could employ this reaction for determining the comparative proportion of ozone in the air of the sea-coast and in that of Manchester, but found that in the latter place, where the ozone was *less*, the reddening reaction was *much more decided*. Here is a visible effect upon the blood produced by the air of towns, the cause of which is unknown, and which may, operating constantly, act injuriously, and thus account for the superior healthfulness of the country.

IV. MICROSCOPISMS AND GERMS IN THE AIR.

Pasteur (Comptes Rendus, l, 303, 849, and li, 348) filtered air through gun-cotton, and after having dissolved the same by alcohol and ether, examined the insoluble remains. He supposes that germs of infusoria are present in all air, and are the cause of fermentation and putrefaction. H. Hoffman and Van der Broeck (Ann. der Ch. und Pharmacie, cxv, pp. 75 and 288) drew the same inference from their experiments. Schroeder and Deuch, (Id., cix, 35,) and Schroeder, (Id., cxvii, 273,) confirm these views by their results. They found that almost all organic substances, even those of ready putrefaction, such as blood, fibrine, albumen, caseine, sugar, starch, &c., were preserved unaltered when heated to the boiling point in a bottle which was immediately stopped by a loose plug of raw cotton, so that, on cooling, the air entering the bottle would be filtered through the cotton and be deprived of solid substances floating therein. They attribute putrefaction and fermentation to the germs of animalcules suspended in the air; a peculiar kind being required for each kind of fermentation. Schroeder found that these germs were destroyed by a heat of 212° Fahrenheit; but that milk, meat, and yolk of egg contain such as require a very prolonged heat at that temperature, or a higher temperature, viz, that of water boiling under pressure, for their destruction.

By the heretofore received theory of Leibig and others, fermentation is a decomposition incited and maintained by a "ferment," or readily oxidizable body. The motion of the atoms in the decomposing ferment is imparted to the atoms of the fermentable body, causing it to fall asunder into less complex compounds. The germ theory has not yet been accepted definitely; experiments and discussions concerning it are in progress, for which consult Pasteur, Pouchet, Berthelot, Schroeder, Boussingault, Karsten, in the Comptes Rendus, Jour. Pr. Ch., &c., *passim*.

Berthelot (Jr. Pr. Ch., lxxxv, 465, and Comptes Rendus) found that in the alcoholic fermentation of 100 parts of sugar, from 95 to 96 per cent. yielded alcohol, the formation of which could be explained by the "ferment" theory; but the remaining 4 or 5 per cent. of sugar formed from 3.2 to 3.6 of glycerine; from 1.2 to 1.5 of cellulose; from 0.6 to 0.7 of succinic acid, and from 0.6 to 0.7 of carbonic acid, together with fat and other undetermined products. It follows from this that the evolution of carbonic acid is not in an exact equivalent proportion to either the sugar or the alcohol. Pasteur found in the experiments before alluded to of filtering air through gun-cotton, dissolving the latter and examining the residue by the microscope, that it contained starch granules and undefined globules, which seemed to him to be spores. When this residue was

brought into sugar-water, certain known animalculæ and infusoria were developed. The same results were obtained, using asbestos for the air filter, and they were absent when the asbestos had been first ignited, and then exposed to the current of air from which the germs were removed before reaching the mineral. He experimented upon air from different localities with a view of ascertaining the relative proportion of germs capable of producing fermentation. For this purpose he prepared a number of glass matrasses containing fermentescible liquids, hermetically sealed at the boiling temperature. When these were opened in any place a certain quantity of air would rush in, together with whatever germs might be present. The flasks were immediately resealed and put aside, when the presence of the germs would soon be manifested by the phenomenon of fermentation, accompanied by the presence of infusoria.

Of 20 specimens of air in each of the three following series—

1st. In the country, near the ground, 8 contained germs.

2d. Upon the first plateau of the Jura Mountains, 2,600 feet elevation, 5 contained germs.

3d. Upon Montanvert, 6,000 feet high, 1 contained germs.

In the cellar of the Paris Observatory, using precautions against disturbing the ground, no air causing fermentation was found; it was as free from that property as air which had been heated.

All specimens of fresh milk coagulate in from three to ten days, and contain chiefly *vibriones*. If, however, milk be boiled for a prolonged period, and heated air, deprived of its germs, be suffered to enter the vessel, it does not ferment. The oxygen of the air attacks the fat, which becomes lumpy and tallowy; (see Wetherill on Adipocire, Transactions Am. Phil. Soc., vol. xi;) but the albumen from which, according to the former theory, a ferment is generated, remains unaltered. The spores of the mucidineæ retain their fermentative power at a temperature of 248° Fahrenheit, but are killed by a half an hour's exposure to a temperature of 266° Fahrenheit. In water, however, they lose their vitality at the ordinary boiling temperature.

Karsten (Liebig and Kopp, Jahresbericht, 1862, p. 106,) discovered an oxidizing power in the air which he deems of value in relation to the question of atmospheric miasms. He found that dry, non-nitrogenized bodies such as sugar, starch, gum, wax, rosin, caoutchouc, cork, &c., are slowly oxidized in the air at ordinary temperatures, with the formation of carbonic acid and water. When the oxygen is not present in excess, the additional products of decay (rottenness) arise. After depriving air of carbonic acid, he passed 60 liters of it, in single bubbles, through a series of vessels, (in which all joints of cork and caoutchouc were avoided,) filled alternately with air free from carbonic acid, and with lime water, and thus always found a precipitate of carbonate of lime, which he attributes to an oxidation of organic matter in the air. He believes that in Elliot and Storer's observations on the difficulty of depriving air of carbonic acid the presence of this gas arose from the oxidation of the joints of cork and caoutchouc; for when air is first passed through a tube containing red-hot oxide of copper, by which its organic matter is burned, and then freed from carbonic acid by caustic potash, no precipitate in the lime-water announces the presence of carbonic acid. By this oxydizing action of the air, due probably to ozone, a self-purification of the atmosphere is constantly taking place.

V. DUST SUSPENDED IN THE AIR.

Pouchet (Comptes Rendus, xlviii, 546) made an extensive microscopic examination of the dust deposited from the air in different places. Some of it had accumulated for ages; as in the ruins of Thebes; in the tomb of Rameses II; in the sepulchral chamber of the great pyramid; in the temple of Venus Athos, at Philé; in the temple of Serapis; at Pouzzoles; in the head of a mummied dog from the pits of Beni-Hassan, and in the cabinet of a Jewish antiquary, at Cairo. Some of the dust of less ancient buildings was also examined, viz, of the tower of St Georges d'Amboise, at Rouen; interior of the Abbey Fécamp; laboratory of the Museum of Natural History, at Rouen, and other places. From the results of thousands of such observations substances were detected by the microscope, consisting, 1st, of mineral origin, being the detritus of the rocks of the locality; 2d, of animal nature, as the dried remains of small infusoria of different kinds; fragments of the antennæ of coleoptera; scales from the wings of nocturnal and diurnal butterflies; hairs of different animals, some of them died red, blue, or green, and derived from clothing; hair of rabbits and bats; epithelial scales; spiders' web, &c.; 3d, of vegetable origin, consisting of fragments of the tissue of various plants, the ligneous fiber in small quantity, but the fragments of cells and vessels being of greater frequency; many vegetable hairs or filaments; pollen; cryptogamic spores; many filaments of cotton, for the most part colorless, but sometimes dyed and proceeding from clothing.

Finally, wherever M. Pouchet's observations extended, whether of ancient or modern dust, the presence of *starch*, of different plants, but especially of wheat, was nearly always demonstrated. The larger starch granules were rare; those detected were of

ovoidal or spherical shape, measuring from 0.014 to 0.028 millimeter in diameter, but more frequently of the latter dimension. The ancient starch polarized light and had all of the physical and chemical properties of recent starch; some of it was of a violet tint, as if by the action of iodine. On the summits of mountains and on other elevated places starch was rarely or not at all detected. Pouchet *compared* the air of different localities by collecting and examining microscopically the solid matters floating in the volume of one cubic decimeter of the air, and found the air of towns loaded with a vast quantity of organic *débris*, and of objects employed in civilized life. In the marshlands and on the plains he found an excess of vegetable particles. In the open sea, far from the shore, and on the mountains, above the zone of habitations, he found, even in a volume of ten cubic decimeters, the atmospheric corpuscules to be very sparse. At sea, however, between Sardinia and Sicily, in the middle of the Ionian sea, or upon the summit of Etna, a cubic decimeter of air always exhibited "immense legions" of ciliated infusoria.

VI. MICROSCOPIC EXAMINATION OF THE AIR OF THE CAPITOL.

On February 20, 1865, glass microscope slides were hung from the ventilating apertures in the House of Representatives, so that they remained suspended horizontally six inches below the ceiling. Two slides, tied back to back, were coated with glycerine and placed at the east end, and two similar ones at the west end of the ceiling. The position of the slides was such that on two dust could fall or settle gradually, and against the remaining two the dust would rise vertically. On March 8 of the same year the slides were examined. No difference was observed between the slides from the east and west end of the ceiling.

Those upon which the dust had settled were coated very perceptibly by it. Examined by the microscope it proved to be principally fine quartzy and earthy matter arising from the streets, the former exhibiting its characteristic colors in polarized light; there were also animal hairs, some of them dyed, (fibers from the carpet,) and epithelial scales from the mouth, starch granules, &c.

Very little matter was deposited upon the slides containing glycerine upon their inferior surface. The objects detected by the microscope were epithelial scales from the month, and starch granules, which exhibited beatifully the black cross by polarized light. Nothing having the appearance of spores was detected in these examinations.

VI. OZONE.

An examination of air for the purposes of ventilation would scarcely be complete without allusion to ozone—a body which has engaged the attention of chemists for the past twenty-five years, but of the true nature of which, notwithstanding the labor of research bestowed upon it, we know so little.

I. NATURE OF OZONE.

The air surrounding the electral machine when in action, and air confined with moist phosphorus, has a peculiar penetrating odor, and exerts a decomposing action upon the iodide of potassium.

These two cases have been referred to one cause—viz, the production of ozone, which is supposed by some to be an allotropic modification of oxygen, analogous to what has been observed in sulphur, phosphorus, carbon, and some other bodies, while others assign for the rationale of the phenomenon a decomposition of ordinary oxygen into its hypothetical constituents, + 0 and — 0. Ozone is the most active oxydant known; it acts energetically by mere contact at the ordinary temperature, carrying bodies to the highest degree of oxidation of which they are capable. Thus silver is converted into the peroxide; phosphorus into phosphoric acid; arsenic into arsenic acid; sulphur, sulphurous acid, and sulphuretted hydrogen, into sulphuric acid; lead and litharge into the peroxide; protoxide of manganese into the peroxide; sulphide of lead into the sulphate; ammonia into nitrate of ammonia, &c.

It also oxidizes many organic bodies; when breathed in sufficient quantities, excites powerfully the organs of respiration, producing cough, and speedily killing smaller animals.

Fortunately it cannot be present in atmospheric air in large quantity; $\frac{1}{1300}$ of this body being the largest proportion with which we have been able to load the air. Substances upon which ozone acts withdraw it from the air.

Andrews and Tait (Phil. Trans., 1860, 113) found that oxygen through which quiet electric discharges were effected experienced a diminution in volume of $\frac{1}{12}$; that when left to itself, at ordinary temperatures, it expanded again very slowly; at 212° Fahrenheit it expanded more rapidly; at 518° Fahrenheit it regained its original volume, and lost all ozone reaction. This, then, is the temperature at which ozone is completely *destroyed*.

The presence of ozone is indicated by its action on paper imbued with the tincture of gum guiacum, which it turns blue, or with paper dipped in a mixture of water and starch, with $\frac{1}{500}$ of its weight of iodide of potassium and dried. The ozone liberates the iodine, which acts upon the starch, producing the characteristic blue color of the iodide of starch.

Certain bodies which have been called "ozone-carriers" possess the peculiar property of absorbing ozone, and yielding it to other bodies upon which it is capable of acting.

Oil of turpentine,* under the influence of light, plantinum black or sponge, and the *blood corpuscules*, possess this property, so important in its physiological relations. Schoenbein found that air containing $\frac{1}{400000}$ of ozone smelled sensibly of it, and is of the opinion that there exists a connection between the amount of ozone in the atmosphere and catarrhal affections. Gorup v Besanez (Ann. der Bh. und Pharmacie, cxxv, 207) acted upon a variety of organic substances by ozone, and studied their products of oxidation. He found that, in the presence of carbonate of soda, grape and cane sugar (the latter, with greater difficulty) were perfectly oxidized by ozone, carbonic and formic acids being the sole products. The volatile fatty acids are also perfectly oxidized, while the fixed ones, such as palmitic and stearic, are acted upon with difficulty. The fats alone are not readily attacked, but in presence of an alkali they are quickly decomposed, the ozone acting upon the glycerine. This author draws important deductions from the action of ozone on organic bodies in his Lehrbuch der Chemie, vol. iii, *passim*.

Contradictory conclusions have been drawn with reference to the relation of the atmospheric ozone to health and disease. Mr. Smallwood, in a long series of experiments upon the ozone of the atmosphere in Canada during the prevalence of the cholera and at other times, favored the idea of a deficiency of ozone during the epidemic.

During the Crimean war the surgeons of the French army established the facts that—

1. The more the ozone reagent papers were colored in the air the more numerous were the sick who were taken to each of the hospitals.
2. The higher the temperature, there were *fewer* entries of sick and fewer deaths.
3. At the three observatories the ozone curve was essentially the same; and
4. The curve for the temperature was also the same.
5. At observatory No. 1 the less the ozone the greater was the number of deaths; while at observatory No. 2 it was the reverse.

Dr. Moffat (Rep. British Association, 1861) concludes, from a large number of observations, that the ozone in the atmosphere plays an important part in controlling or permitting epidemics, which it effects by removing the poison from the air. During the prevalence of the cholera at Newcastle, in 1853, the ozone was at its minimum. From August 24 to September 11, 1854, ozone was only once perceived, and then in a minimum quantity. The cholera was then at its height in London. Dr. Moffat states that, on the 10th of September, with a south wind, the ozone increased and the cholera cases diminished.

Bineau (Ann. de Ch. et de Phys., [3] xlii, 462) detected ozone but seldom in the air of Lyons, although he observed it always in the air of the neighboring country. He attributes the deficiency in the city to the action of organic substances in the air.

Pless and Pierre (Wien, Acad. Bericht, xxii, 211) discovered 0.02 milligram of ozone in 255 liters of air.

Zenger (Id., xxiv, 78) found, from 12 experiments, from 0.002 to 0.01 milligram in 100 liters of air.

R Angus Smith (Qr. Jour. Ch. Soc., xi, 196) found that the air of Manchester did not react with ozonoscopic paper, nor was there any reaction in the country when the air came from the city, which he attributes to the absorption of ozone by the products of combustion arising from the large amount of coal consumed in the city.

C. Kosmann (Comptes-Rendus, lv, 731) ascertained that in Strasburg, and at a short distance therefrom, there was more ozone in the air of the country than in that of the city. In the city the maximum of ozone was in the day time; in the country it occurred in the night. He found also, by the action upon Schoenbein's test paper, that the green portions of all plants exhaled ozone.

Mr. Carey Lea (Am. Jour. Sci.) discovered that the growth of plants is retarded in an atmosphere strongly impregnated with ozone.

A. Poey (Comptes-Rendus, lvii, 344) found that, in the city of Havana, the ozone reaction diminished with the elevation, while in the country it increased. He found also that the atmospheric moisture influenced the amount of ozone.

J. Boehm (Bericht Acad., Wien, xxix, 409) has given the results of four years' regular observations upon the ozone of the atmosphere made in the city and environs of Prague.

The observations were made with ozonoscopic paper exposed to the atmosphere, observed and changed at 7 a. m. and 7 p. m.; the proportion of ozone being determined by the depth of shade of the color produced.

---

*Schoenbein saturated oil of turpentine with ozone to a degree that it had double the bleaching power of good hypochlorite of lime, (bleaching powder.)

Boehm obtained different results with paper prepared from the same formula by different persons, and claims but general conclusions from his observations. He has tabulated his results, and has illustrated them from January, 1857, to March, 1858, by a series of curves representing the relative humidity, rain, snow, or fog, clouded proportion of sky, strength and direction of the winds, and ozone.

From a consideration of these curves it is seen that the ozone bears no relation to the relative humidity, rain or thunder storms, clouds, &c., but is intimately connected with the force and direction of the wind, which was generally from the west, when the phenomenon of ozone was perceived.

Boehm attributes his effect to the position of the observatory in the city of Prague; the easterly winds passing over a portion of that town, which is thickly settled and crowded with factories, the emanations of which deprive the air of its ozone.

In the country and in the suburbs the presence of ozone was found to be constant. The author, without expressing a decided opinion on the relations existing between the presence of ozone in the atmosphere and health, calls attention to the fact that, in Koenigstadt, a place not particularly noted for salubrity, he obtained as decided reactions of ozone upon the healthiest mountains, and that the coloration of the test paper is more decided in Vienna, a city noted for its lung and typhoid fevers, than in Prague, which is ranked justly with the healthiest of towns.

M. Hozeau, of Rouen, inferred, from a series of observations which extended over four years, that the atmospheric ozone is least in February, begins to increase in March, and reaches its maximum in May and June, after which month it diminishes to its minimum in February.

Dr. W. B. Rogers (Am. Assoc., Albany meeting) observed that the action of the city of Boston deprived air passing over it of its ozone.

II. EXPERIMENTS ON OZONE IN WASHINGTON.

The following experiment was performed to ascertain whether the ozonoscopic test might not be increased in delicacy. Some test paper was prepared according to the following formula of Osann: thirty-two grains of starch were rubbed in a mortar with the same amount of cold water; four ounces of water, in which three grains of iodide of potassium were dissolved, were boiled and mixed well with the starch; the whole was boiled again, cooled, and placed in a stoppered bottle. When test paper was needed the bottle was shaken, slips of Swedish filtering paper were dipped in the liquid and dried. This paper was instantly colored of a deep shade when dipped in a bottle of air ozonized by phosphorus. When exposed over night to the external air, at the Smithsonian Institution, the ozone reaction was very decided.

At 3*h*. 30*m*, March 6th, twenty-four liters (6$\frac{1}{3}$ gallons) of air were drawn, by an aspirator, from a hole in a south window of the Smithsonian laboratory; the air being from the south and consequently not passing over the densely populated quarter of the city. The air traversed a drawn-out glass tube and impinged upon a slip of the test-paper contained in a Woulfe's bottle, which was covered with black paper to prevent the bleaching action of the light upon the iodide of starch. The current of air was drawn slowly, so that two and a half hours were needed to aspirate twenty-four liters. The experiment was repeated twice on different days, once keeping the test-paper moist. It was impossible to detect the slightest reaction of ozone. On the night of March 8th ozone reagent papers were exposed to the external air outside of a window of the Smithsonian laboratory, and in a similar position at a dwelling on F street north, between 11th and 12th streets west, in a populous locality of Washington. The papers of the latter position did not give any indication of ozone, but those at the laboratory, exposed to the air of the Smithsonian park, evinced a decided ozone reaction. Hence the air of the public grounds contains ozone when that of the crowded city does not. This experiment was repeated several times with similar results.

III. THE RELATION OF THE VENTILATION OF THE CAPITOL TO OZONE.

The air entering the fans at the Capitol was found by the test-papers to contain ozone, differing in this respect from the crowded city.

On February 28th, at 12*h*. 45*m*. p. m., slips of ozone reagent paper were placed in the current of air entering the fan of the House of Representatives, and also at the ceiling of the hall, in the apertures for ventilation, through which air of the temperature of 77° Fahrenheit was issuing. As a controlling experiment, slips of the same paper were dipped in ozonized air and found to be colored of the same shade. Some of the paper was exposed to the external air at the laboratory. On the subsequent day, at 3*h*. 30*m*. p. m., the papers were examined. Those of the fan-room and of the external air at the laboratory gave a moderate but decided ozone reaction, which was greater in the case of the laboratory papers. The air leaving the hall gave a very slight evidence of ozone, merely enough to see that it was present. The ozone might have been removed from the air furnished by the fan either by the action of the hot coils, or by the

organic matters imparted to the air by the audience. If the heat had not destroyed it, the experiment gave proof that the fan furnished ozonized air to the hall. If the ozone was lost in the hall, it performed thereby efficient service in neutralizing the organic matter in the air which might be injurious. Further experiment was therefore required to ascertain whether the ozone was lost by the heat. Ozonized air, passing through a tube heated above the boiling point of water, is completely deprived of its ozone. On March 8, at 1 p. m., after the adjournment of Congress, slips of test-paper were placed in the main air-duct of the ventilating machinery of the House of Representatives, in the current, some of them immediately in front and the rest in rear of the heated coils. The fan was in action until March 11, and the papers were examined on March 15, at 10*h*. 30*m*. a. m. All of the papers exhibited the reaction of ozone, but it was less intense in the hot air. The closed shutters of a window had been opened inadvertently, suffering diffused daylight to fall upon the papers in the hot air, but the less intense tinge of the latter is not attributable so much to the light as to the heated coils which probably deprived the air of a certain portion of its ozone; the air, however, passes the coils too rapidly to lose much of its ozone by this means. The fact was thus established that *ozonized air* is furnished to the audience in the halls. Ozone could be readily generated in the air-duct by Dr. Delabrousse's plan, employing a spiral wire of platina, rendered incandescent by a galvanic battery; but such provision is unnecessary.

M. Saint Pierre (Comptes-Rendus, lviii 420, 1864) discovered a remarkable production of ozone by the action of certain kinds of ventilating apparatus. He found that test-paper, placed in the tuyere pipe of a blast furnace, gave evidence of ozone in a much stronger manner than when in the external air, and to show that the velocity of the current of air bringing greater quantities of air to the paper was not the cause of the reaction, he placed, at the same time, similar papers on the governor of a steam-engine in a saw-mill. From these and other experiments he concludes that the reaction arises from compressing the air. I have seen no reason for my experiments to suppose that ozone is generated by the action of the fan in the ventilating machinery of the Capitol.

Antozone.—The late researches of Schoenbein, Meissner, and others, have resulted in the discovery of another condition of oxygen, in which it has chemical properties antagonistic to those of ozone, and which has, in consequence, been called "*antozone.*" As this body has probably an important bearing upon the hydration of dry air, it will be necessary to consider it in this report.

Schoenbein discovered that if a few drops of acetate of lead solution be added to diluted peroxide of hydrogen, the peroxide of lead ($Pb O_2$) is formed. The same reaction takes place if ozonized oil of turpentine be employed, or if ozonized oxygen be brought in contact with basic acetate of lead. In these experiments the peroxide of lead is produced by the oxidation of the protoxide of lead by ozone. When the peroxide of lead remains in contact with the peroxide of hydrogen, both are reduced, the result being water, protoxide of lead, and ordinary oxygen.

Schoenbein concluded, therefore, that the oxygen is in a different condition in the peroxides of lead and hydrogen. In the peroxide of lead it exists as ozone, ($Pb O \overline{O}$,) and in other bodies which this chemist grouped together as "*ozonides*," such as peroxides of manganese and silver, permanganic and chromic acids, the oxygen is in the same condition; but in the peroxide of hydrogen the oxygen is contained in a different condition, ($H O, \overset{+}{O}$,) which he calls antozone. In peroxide of barium it is in the same condition, and all of such bodies Schoenbein terms "*antozonides.*" In the conjunction of an ozonide with an antozonide, the different kinds of oxygen neutralize each other to form ordinary oxygen; we have then—

Air	$\overset{+}{O}\ \overset{-}{O}$
Ozone	$\overset{-}{O}$
Antozone	$\overset{+}{O}$
An ozonide	$M\ O, \overset{-}{O}$
An antozonide	$M\ O, \overset{+}{O}$

It was requisite for establishing the correctness of this hypothesis to produce antozone and to investigate its properties; but this body had already been prepared from peroxide of barium and oil of vitriol, and was supposed to be ozone. Schoenbein found that if this peroxide be projected in small quantities in cold monohydrated sulphuric acid, antozone escapes as a gas, mingled with ordinary oxygen, which latter, as he states, is formed from the antozone by the elevation of temperature during the reaction.

Antozone blues the iodide of potassium and starch like ozone, and has a smell like that gas, being more disagreeable. A distinguishing characteristic of antozone is

the formation of peroxide of hydrogen when it reacts with water, which ozone does not occasion. Among the different tests for these gases it is sufficient to note that of a slip of paper soaked with solution of sulphate of manganese, which is rendered brown in ozone from the formation of peroxide of manganese. In antozone not only does this reaction not take place, but a paper browned by ozone is bleached by antozone.

Meissner discovered that air or ordinary oxygen, electrified by Ruhmkorff's coil, well dried, and then passed into water or moist air, gave rise to a mist, or cloud, which was found to be due to the formation of antozone. The cloud could be caused to disappear by contact with drying substances such as oil of vitriol, chloride of calcium, &c., but would form again upon introducing the antozonized air into a moist atmosphere. By standing, the electrified air gradually lost its cloud-forming property, the water being deposited upon the sides of the vessel containing the gases. Meissner regards peroxide of hydrogen as a component of antozone with water; and clouds, or vesicular mist, as a physical aggregate of antozone and steam, in which the chemical attraction of the two is much weakened, if not destroyed. He attributes the gradual disappearance of the cloud to the return of the antozone (by combining with ozone) to its condition of ordinary oxygen. Von Babo attributes the mist to the formation of peroxide of hydrogen, and its disappearance to the precipitation or gradual decomposition of this peroxide. Meissner believes that tobacco, chimney, and gunpowder smoke, and that even the atmospheric clouds are due to antozone, which arises from all processes of oxidation.

While there is much to be learned respecting antozone, the cloud-forming attribute of this body is very interesting in connection with ventilation, and may serve to explain the difficulties which, according to some statements, have been found in communicating moisture to a current of air by means of steam. The escape of steam under favorable conditions is accompanied by electrical phenomena, and the production of ozone and antozone is thus possible. It is conceivable that an antozone cloud thus generated, and not having time while traversing the air-passages to deposit its vesicles of water, might be swept along into the apartment to be ventilated. According to Meissner, water condensing from oxygen or atmospheric air has always the form of vesicles, while in separating from other gases it assumes the condition of solid drops, or rain.

It might be more prudent, before adopting a method to supply to the air of the halls of legislation that amount of moisture in the winter time which is absolutely necessary to the health of the members, to institute a particular series of experiments upon the relations of antozone to the subject.

IV. RESUMÉ.

It follows from the experiments which have been given in detail in this report that—

1. The ventilation of the Capitol is abundant.
2. The air furnished is pure; and
3. It contains more ozone than the air of the
4. The source whence the air is taken is proper; but more cleanliness should be observed upon the terraces, &c., above the surface of which (if any alteration be deemed necessary) the air-shaft should rise not above three feet.
5. The principal defect of the air, and the cause of complaint, is in the hydration. This can and should be remedied.
6. The dust is dependent upon the condition of the streets of Washington; it rises at times above the summit of the dome of the Capitol. It might be removed by the method of hydrating the air in which sprays or films of water are used.
7. An extended research upon the proportion of carbonic acid in the atmosphere of America is needed. It has been performed for Europe; but in America, where the population is less and the vegetation is greater, scarcely anything has been done. Important scientific and practical results may be expected from such a research.

I am, gentlemen, very respectfully, your obedient servant,

CHARLES M. WETHERILL.

THOMAS U. WALTER,
Architect Capitol Extension.
Professor JOSEPH HENRY,
Secretary Smithsonian Institution.

CONCURRENT RESOLUTION authorizing appointment of select committee, passed in the Senate March 18, 1869.

Resolved, That a joint select committee be appointed, to consist of three members of the Senate and three members of the House of Representatives, to examine into the present condition of the Senate chamber and of the hall of the House of Representatives as regards lighting, heating, and ventilation, and their acoustic properties, and the defects and disadvantages existing in the same, and the cost, and the best method of providing remedies therefor; and that they have leave to report by bill or otherwise, and shall report also upon the probable cost thereof.

Concurred in by the House January 18, 1870.

Committee on the part of the Senate:

Mr. NYE, of Nevada.
Mr. ANTHONY, of Rhode Island.
Mr. STOCKTON, of New Jersey.

Committee on the part of the House:

Mr. JENCKES, of Rhode Island.
Mr. SANFORD, of New York.
Mr. SWANN, of Maryland.

INDEX.

	Page.
Report by Mr. Jenckes, from the Select Committee on Ventilation, on present condition of Senate chamber and hall of House of Representatives as regards the lighting of the halls	1–15
Of the mode of heating the hall	3–5
Of the ventilation of the hall	5–11
Of the plans submitted to the committee	11, 12
Of the management of the heating and ventilating apparatus	13, 14
Of the different theories	14, 15
Cost	15
Propositions	15

APPENDIX.

Report of H. F. Hayden, chief engineer of heating and ventilating department, United States Senate	15–17
Architect's report on proposed improvements	18
Architect's report on cooling apparatus	18, 19
Estimate for making a change in the arrangement in lighting the ceiling of the hall of the House of Representatives, by Samuel Gardiner, electrician	19
Order for change	19
Effect of heat from the burning gas in the Senate chamber	19
Propositions of Henry A. Gouge for ventilation of the United States Capitol, with three diagrams	20–22
Plan and proposition of Alban C. Stimers for the ventilation of the hall of the House of Representatives, being part of House Report No. 19 of Fortieth Congress	22–40
Estimate by A. C. Stimers of cost of introducing a system of ventilation into the House wing of the United States Capitol	40, 41
Reply of Architect of the Capitol Extension to Chairman of Committee on Ventilation, United States House of Representatives, giving opinion on plans of A. C. Stimers	41
Reply of A. C. Stimers, giving total weight upon each rafter, including new ceiling, with surplus strength after new ceiling is built	41
Reply of Horatio Allen to Hon. Stephen Taber, giving opinion on Mr. Stimers's report on ventilation, &c	42
Letter from Alban C. Stimers to Hon. Stephen Taber on mechanism for cooling air in hot weather	42, 43
Proposition by Alban C. Stimers to Hon. James W. Nye, Chairman of Joint Select Committee on Ventilation and Acoustics Forty-first Congress, to warm in cold weather, cool in hot weather, and ventilate at all times the Capitol extension	43–64
Letter from A. C. Stimers, suggesting a course of experiments to determine the exact character of the present ventilation of the halls of Congress	64, 65
Luther Robinson's plan for ventilating the wings of the United States Capitol, with diagram of a cross-section and a view of ventilators on roof	65–70
Report by Mr. Covode, from the Committee on Public Buildings and Grounds, Thirty-ninth Congress, on the ventilation of the hall of the House of Representatives, June 20, 1868	70–72
Report from Herman Haupt to Hon. John Covode, containing views upon a correct system of ventilation	72–75
Reports from Lewis W. Leeds to Hon. John Covode on the subject of ventilation	75–78
Letter from Joseph Henry, Secretary Smithsonian Institution, to Hon. Thomas A. Jenckes, on the glass in ceilings of the halls	78
Letter from Lewis W. Leeds to the Joint Committee on Ventilation Forty-first Congress	79
Report accompanying plans for the improvement of the ventilation and heating of the hall of the House of Representatives, by Lewis W. Leeds	79–82

O

41ST CONGRESS, 3d Session. } HOUSE OF REPRESENTATIVES. { REPORT No. 50.

THOMAS H. DOWLING—CLAIM TO YERBA BUENA.

MARCH 3, 1871.—Ordered to be printed and recommitted.

Mr. MAYHAM, of the Sub-Committee on Private Land Claims, made the following

REPORT.

The Sub-Committee on Private Land Claims, to whom was referred the claim of Thomas H. Dowling to the Island of Yerba Buena, respectfully report:

That in September, 1835, the secretary of the late Governor Figueras, then acting as governor *ad interim* of California, gave to Gorham Hyronemo Nye a certificate to the effect that said Nye was the owner of Wood Island, one league distant from the pueblo of Yerba Buena, in the bay of said pueblo, which island is now known as the Island of Yerba Buena; which certificate recited, among other things, that said island was given to said Nye as a compensation for transporting the body of the deceased Governor Figueras from Monterey to Santa Barbara, and assured to him the possession of the same; that said Nye took possession of said island, and occupied the same from that time until September 10, 1849, when he sold the same by parol to Thomas H. Dowling, who thereupon took possession of said island and occupied it until about December, 1864, when said Nye executed and delivered to him a deed for the same; that during the time he so occupied said island said Dowling made valuable improvements thereon by erecting buildings, cultivating and improving the land, and, by docking out into the bay and filling in, extended the area of the same about two acres.

In 1850 President Fillmore gave notice that said island was required by the Government for military purposes, but took no steps toward taking possession of the same further than that of giving said notice.

By the charter of the city of San Francisco that city embraced the entire county of that name; and this island, being within the county of San Francisco, was therefore within the city limits of said city.

In June, 1855, the municipal government of San Francisco passed an ordinance known as the Van Ness ordinance, by which they assumed to cede to all the settlers and occupants of lands within the limits of the city the title to the same, which ordinance provided that the title should vest under the same in the occupants as absolutely as if conveyed by deed.

In March, 1858, the legislature of the State of California passed an act confirming and legalizing said ordinance, and reënacting its provisions in respect to the title to lands within the limits of said city.

In 1864 Congress, by an act approved July 1, 1864, legalized and confirmed the act of the legislature of California aforesaid in relation to the lands within the limits of said city, reserving such lands within the lim its of said city for military and naval purposes as had been or were then occupied by the United States, or might be designated by the

President of the United States within one year after the city limits should be ascertained and recorded in the General Land Office of the United States, for military, naval, or other public uses. No such survey has ever been made or recorded.

On the 12th day of October, 1866, the President of the United States directed the General of the Army, then in command of the military post at San Francisco, to take military possession of said island; and pursuant to said order a detachment of ten United States troops entered upon said island and ejected therefrom by force the said Thomas H. Dowling, and have since that time retained the possession thereof. The island consists of about 150 acres, and is situate in the bay of San Francisco, about one mile from that city, and is claimed to be of no inconsiderable value.

Mr. Dowling insists that he should be restored to the possession of the same upon the following grounds:

1st. That under the laws of Mexico, the certificate made to Nye was a valid inchoate grant, and needed only the confirmation of the departmental assembly or the sanction of the Mexican government to render it a complete title, and but for the acquisition of California by the United States the Mexican government would have been bound to ratify and confirm the same; and that the United States in succeeding to the interest and jurisdiction of Mexico succeeded also to its obligations, and became bound to perfect this grant.

2d. If this certificate to Nye was not valid as an inchoate grant by reason of some defect in its form or informality in its execution, or even want of power in the acting governor to make it, still it was such a claim or color of title as to be the foundation for a valid prescription, it having been received by Nye in good faith for a valuable consideration, and relied upon by him as a title from 1835 to the time of his sale to Dowling, and by Dowling from that time until 1866, when the United States took forcible possession, and that as the civil law was in force in Mexico at the time the United States acquired California, a prescriptive right was good as against the Government.

3d. That if the certificate to Nye was not good as a grant or as the foundation of a prescriptive right to these lands, still the title of Dowling is good as against the United States under the ordinance of the municipality of San Francisco, sanctioned by the legislature of California and the act of Congress of July 1, 1864.

The most convenient method of examining the claims of the petitioner, Mr. Dowling, is in the order in which they are presented; and the first inquiry is: Did Mr. Nye, under the certificate from the acting governor of California, acquire a valid inchoate, legal, or equitable title to this island under the Mexican colonization laws? The Mexican colonization laws, passed in 1818 and amended in 1824, authorized the governors of each state or province in Mexico to grant the petition of Mexicans or foreigners to settle upon and occupy lands for agriculture or pasturage in quantities not exceeding eleven square leagues, and, with the assistance of prefects, to put such settlers in possession, and on the ratification of such grants by the departmental assembly of the Mexican government they became valid titles, and the occupant thereupon became vested with the legal title to the lands so granted.

It is quite apparent that the formal requisites of a grant under this law were not all complied with on the part of Mr. Nye. No petition, as required by the colonization law, seems to have been filed with the governor, and no formal possession given by a magistrate to the occupant, nor were any of the acts done ever confirmed by the departmental

assembly. It follows, therefore, that Mr. Nye acquired no valid legal title to the land in question of the Mexican government, and cannot, as a strict legal right, demand of the United States a patent on the ground that he acquired of Mexico a valid inchoate title, which that government was bound to perfect. Had he such a right as equity would enforce as between individuals and as the United States in good faith is called upon to respect?

It is a well-settled principle in equitable jurisprudence that contracts for the alienation of land, although not valid as law, may be enforced in equity when substantial justice requires it. The court will always have an eye to the substantial justice of the case. Generally, delivery of possession, and making beneficial improvements which would work a fraud upon the party making them unless the agreement is carried out, is a sufficient ground for the equitable interference of the court to uphold or enforce a contract void at law. (4 Kent Com., 10th ed., p. 537.) In this view of the case, Nye, who occupied this island under a written certificate from the governor of California, from 1833 to 1849, and Dowling, his grantee, who occupied under his deed, from 1849 to 1866, and during that time erected mills, machinery, forges, shops, and dwellings, and built wharves and docks, present strong equitable claims for a title which the courts of equity, as between individuals, would not hesitate to enforce. But it may be said that Government cannot, like an individual, be compelled to submit to the equitable powers of the court; and this is true, but it is the highest attribute of Government to do right, and this it may do, when the right is perceived through the action of Congress.

The next position taken by the petitioner is, that he has a valid title against the United States by prescription. It is conceded by the claimant that at common law adverse possession or prescription cannot be set up as against the Government. But it is claimed that the rule is different under the civil law, and that was the law of Mexico at the time of its acquisition by the United States, and, therefore, that rights originating under the Mexican government are to be determined by the civil law. Without controverting the soundness of the latter proposition, the former is believed to be untenable.

It was a principle of the Roman civil law that the crown lands, of which the emperor, as such, has only the usufruct, the property or dominion thereof being in the state, are not liable to prescription of any length of time. (2 Colquhoun on Roman Civil Law, p. 149, sec. 1121.)

But by the Spanish Recopilation Laws of the Indies, it appears that persons who have made their habitation upon lands and cultivated them for four years shall have the right of disposing of them as their own property. And under this law it has been held by the courts in Louisiana that a valid prescription may be created against the Government. (Sanchez *vs.* Conzales, 11 Martin La. R., 210; Pepper *vs.* Dunlap, 19 La. R., 141.) If this was the law of California at the time of its acquisition by the United States, then the grantee of Nye had a valid title by prescription, which the United States Government, under the treaty of Guadalupe Hidalgo, would be bound to respect, unless that title was forfeited by the failure of the occupant to prove up and establish his claim before the board of California land commissioners, under the act of March 3, 1851.

It remains to consider the effect of the action of the United States Government since the acquisition of California in relation to this island. The first official notice taken of this island by an officer of the United States was that published by President Fillmore on the 6th of Novem-

ber, 1850; that the island was reserved for military purposes, but no actual possession was taken of it at that time—Dowling continuing in possession—and on the 20th of June, 1855, the city of San Francisco, by an ordinance of its municipal government, ceded all the right, title, and interest of said city to the land within her corporate limits to the parties in the actual possession thereof, by themselves or tenants, and to their heirs and assigns forever; and on the 11th of March, 1858, the legislature of the State of California confirmed the ordinance of the city, and declared that persons in possession of lands embraced therein shall be deemed to be vested with the absolute title. On the 1st of July, 1864, Congress passed an act which provides "that all the right and title of the United States to the lands within the corporate limits of the city of San Francisco, as defined in the act incorporating said city, are hereby relinquished and granted to said city for the use and purposes specified in the ordinances of said city, ratified by the act of the legislature approved on the 11th of March, 1858; excepting from such relinquishment and grant all sites or other parcels of land which have been or now are occupied by the United States for military, naval, or other public uses, or such other sites or parcels as may hereafter be designated within one year after the survey of said city," &c.

The United States had not occupied, and were not, at the passage of this act, occupying this island, or any portion of it. The order of President Fillmore had never been enforced, and Dowling, being in possession at the time of the passage of the act in 1851, was vested with the title, subject to a defeasance by the order of the President in pursuance of that act.

The power to dispose of the public lands of the United States is vested solely in Congress, and the act of Congress of July 1, 1851, vested the title in the occupant, notwithstanding the order of President Fillmore, which does not appear to be in pursuance of law, especially as such land was not held for military, naval, or public uses at the time of the passage of that act.

But the right of the Federal Government to establish military and naval stations, arsenals, dock-yards, &c., as well as the right expressly reserved in the act of July 1, 1851, would clearly authorize the Government to take this island, or so much of it as is necessary for military purposes. Can they do so without any indemnity to Mr. Dowling? It can hardly be claimed that he has no property-rights in this island and in the improvements which he put upon the same; and by the act of July 1, 1851, the legal title vested in him, subject to the contingency of being divested by an order of the President. That same contingency attached to all the property in the city of San Francisco held under the ordinance and acts above referred to. It will not be claimed that the valuable improvements made by individuals in that great and growing city are subject to be taken by the United States without compensation, when, in the judgment or caprice of the President, they may be needed for military, naval, or public uses. Such a rule would be opposed to the plainest principles of justice, as well as in conflict with that provision of the Constitution which forbids the taking of private property for public uses without just compensation.

APPENDIX.

STATE OF CALIFORNIA, *City and County of San Francisco, ss:*

Charles A. Howard, being duly sworn, does depose and say that deponent has been living in Yerba Buena and its successor, San Francisco, California, ever since the year 1846; that he, deponent, in 1847, on various occasions, went to shoot goats on a certain island in the bay and harbor of San Francisco, called the Goat Island; that deponent was ordered away by one Gorham H. Nye, said Nye stating to deponent that he, Nye, was the owner of said island, and the goats were his, Nye's, property; that he, deponent, knows that Thomas H. Dowling did reside upon said island in the year 1849, and he, Dowling, had possession thereof, and deponent was then informed by said Dowling that he, Dowling, had acquired the title thereto by purchase from said Nye. Deponent further says that since the year 1849 he, deponent, has visited said island on several occasions and has found considerable improvements made thereon.

CHARLES A. HOWARD.

Subscribed and sworn to before me this 7th day of September, A. D. 1868.

E. V. SUTTER,
Notary Public.

DISTRICT OF COLUMBIA, *City and County of Washington, ss:*

Willard B. Farwell, being duly sworn, deposes and says that he is at present a resident of the city of Washington, in the District of Columbia; that he was for sixteen years or thereabouts, up to 1866, a citizen of San Francisco, in the State of California; that during a portion of said period affiant was in the service of the Government of the United States; that about the year 1854, affiant had occasion to examine and select the rock most suitable for the use of the Government in the construction of fortifications, &c., in and about San Francisco harbor, and for that purpose went, in company with Professor William P. Blake, to examine and test the rock on the "Yerba Buena" or Goat Island, in the bay of San Francisco, then occupied by Thomas H. Dowling; that this visit was made to said island on or about the year 1854; that a careful examination of the rock of said island was then made by said Professor Blake and affiant, and in the opinion of affiant, and as then expressed by Professor Blake, the said rock was superior to any other in that vicinity for the purposes required. Affiant then called upon Mr. Dowling for the purpose of ascertaining whether he had any valid claim to said island, and whether contracts could safely be made with him for such rock. Said Dowling then produced the title papers under which he claimed said island, among which was a certificate in Spanish, purporting to have been signed by the secretary of Governor Figueras. That affiant has read the printed affidavit of the claimant, Thomas H. Dowling, contained in the pamphlet accompanying his memorial in Congress, and although affiant cannot at this late day testify positively as to the contents of said certificate, yet that, to the best of affiant's recollection, the said contents as contained in said affidavit of said Dowling are in substance the same as contained in the original certificate as now remembered by affiant. And affiant further states that after such interview large quantities of such rock were purchased of said Dowling for the use of the United States.

And further deponent saith not.

W. B. FARWELL.

Subscribed and sworn to before me this 26th day of January, 1871.
[SEAL.]

JAMES H. MCKENNEY,
Notary Public, Washington County, District of Columbia.

UNITED STATES OF AMERICA,
District and State of California, City and County of San Francisco, ss:

Terivio Tanferan, being duly sworn, deposes and says that he has been a resident of the State of California ever since the year of our Lord 1840. That his residence from said year, 1840, to the present time, has been in what is now called the city and county of San Francisco, it being the same which was formerly called and known by the name of "Yerba Buena." That ever since said year, 1840, he has been acquainted with the island formerly (and now sometimes) called "Yerba Buena" Island, which island of

late has sometimes been called "Goat Island;" which island lies in the bay of San Francisco, about two miles to the eastward of the city front of said city of San Francisco. That deponent was acquainted with Captain Gorham H. Nye as long ago as the year 1840. Said Nye was then the commander of the brig "Bolivar." Said Nye was in the year 1841 (and perhaps earlier) occupying said Yerba Buena Island. That said Nye continued to occupy said island, and had the sole possession thereof from the year 1841, (and perhaps still further back,) until he sold the rights which he held there to Captain Thomas H. Dowling, which sale was about the year 1849, 1850, 1851, or 1852. Deponent cannot recollect exactly as to the year, but does recollect that soon after said Nye completed said sale to said Dowling, and placed said Dowling in possession of said island, he the said Nye came to deponent's house and resided with deponent for some time. The said Captain Nye was the man who introduced said Captain Thomas H. Dowling to deponent, about the year 1849 or 1850. Deponent knows that said Dowling occupied said island from the time said Nye placed him in possession thereof as aforesaid, for several years thereafter, but does not know whether or not he still continues to occupy said island, though he has heard that the United States troops recently expelled him therefrom.

TERIVIO TANFERAN.

Subscribed and sworn to before me this 10th day of November, A. D. 1868.
[SEAL.]
H. F. LARDNER,
United States Commissioner.

STATE OF CALIFORNIA,
City and County of San Francisco, ss:

W. F. Swasey, being duly sworn by me, Samuel Hermann, a notary public in and for said city and county, duly commissioned and sworn, deposeth and saith on oath as follows: I arrived in Yerba Buena (near the city of San Francisco, in the State aforesaid) in the month of December, in the year 1845, and was immediately engaged by Captain W. A. Leidesdorff, vice-consul for the United States, as his clerical assistant. At that time I was intimately acquainted with Captain G. H. Nye, and know that he held possession of the Island of Yerba Buena (as it was generally and notoriously understood) under a permit from the Mexican government. He had a house and corral on the island, and also quite a number of sheep and goats; he also used it for the purpose of drying and salting bullock hides and as a general repository for the hides and tallow purchased by him throughout California. His right to the possession of the island was unquestioned and undisputed; and I do most sincerely believe that, under the Mexican government, that right would have been respected forever. It certainly was respected and considered his absolute property by the people generally in California at the time. I also know that Thomas H. Dowling purchased and went into possession of the island in 1849, and has held almost continuous possession of the property up to the present time. It is in my opinion the only natural and geographical terminus and depot, not only for the Pacific Railroad, but for the commerce between Japan, China, the Indias, and the continent of North America. Its importance to the commerce of this continent will, in my judgment, forever inhibit its being dedicated to purposes of harbor defenses and fortifications, especially as San Francisco is amply and sufficiently protected by the fortifications of other points in the harbor already erected. Its value for the purposes of trade and commerce may be computed at millions.

In faith whereof he hereunto subscribed his name.

W. F. SWASEY.

Subscribed and sworn to this 13th day of November, A. D. 1868, before me.
[SEAL.]
SAML. HERMANN,
Notary Pubiic.

DEPARTMENT OF THE INTERIOR, GENERAL LAND OFFICE,
February 6, 1871.

SIR: I have the honor to acknowledge the receipt of your letter of the 23d ultimo, in reference to the claim of Thomas H. Dowling to the island of Yerba Buena, in the bay of San Francisco, California, and in reply to your request that this office furnish you with copies of any official documents on file tending to establish the right of the United States to said island as against the claimant, I have the honor to inclose herewith the following papers, being copies of official evidence of the ownership of said island on the part of the Government, to wit:

1. Copy of the President's order dated November 6, 1850, reserving Yerba Buena Island for military purposes.

2. Copy of a letter from Secretary of War to the President, under date of October 6, 1866, requesting that the island of Yerba Buena, which had been surveyed, and batteries

projected for its military occupation, may be reserved as an exception to the relinquishment of land to the city of San Francisco, under act of Congress approved July 1, 1864, with the President's order indorsed thereon, and bearing date October 12, 1866.

3. Copy of a communication from the Commissioner of the General Land Office, dated January 11, 1868, addressed to Hon. J. M. Howard, chairman of Committee on Pacific Railroad, United States Senate, on the subject of the title to Yerba Buena Island, granted by Mexican Governor Alvarado to Juan José Castro, November 8, 1838, confirmed by the board of land commissioners, May 22, 1855, to Joel S. Polack, but the claim having since been rejected by the court, order granting an appeal was filed on the 31st day of August, 1867, of the result of which this office is not advised.

I would respectfully suggest an application to the United States Attorney General for further information on the subject of final action in the case.

I have the honor to be, very respectfully, your obedient servant,

W. W. CURTIS, *Acting Commissioner.*

Hon. S. L. MAYHAM,
House of Representatives.

[Extract.]

The President of the United States exempts and reserves from sale, for public purposes, the following tracts or parcels of land in the State of California, in the bay of San Francisco, California.

* * * * * * * *

3d. Yerba Buena Island.

* * * * * * * *

MILLARD FILLMORE.

WASHINGTON, *November* 6, 1850.

WAR DEPARTMENT,
Washington City, October 6, 1866.

SIR: I have the honor to request that Yerba Buena Island may be designated as an exception to the relinquishment of land to the city of San Francisco, California, which was authorized by the act of Congress approved July 1, 1864. The island being of importance for defensive purposes, has been surveyed by the Government, and batteries have been projected for its occupation. It is the opinion of the United States district attorney for the northern district of California, that while the act above cited transfers Yerba Buena to the city of San Francisco, it yet clearly gives to the Government the right to secure the property and except it from the transfer at any time within one year after a certain plat shall have been deposited in the General Land Office, by the following provision, being part of the act itself:

"There being excepted from this relinquishment and grant all sites or other parcels of lands which have been or now are occupied by the United States for military, naval, or other public uses, or such other sites as may hereafter be designated by the President of the United States within one year after the rendition to the General Land Office, by the surveyor general, of any approved plat of the exterior limits of San Francisco, as recognized in this section, in connection with the lines of the public surveys."

It has been ascertained that the plat thus referred to has not yet been transmitted to the General Land Office.

I have the honor to be, sir, your obedient servant,

EDWIN M. STANTON,
Secretary of War.

The PRESIDENT.

[Indorsement.]

EXECUTIVE MANSION,
Washington City, October 12, 1866.

Whereas the island of Yerba Buena, in the bay of San Francisco, is needed for defensive purposes, and has been surveyed by the Government, and batteries projected and planned for its occupation, the within application is approved, and referred to the Secretary of the Interior, with directions to except and reserve the island of Yerba Buena, in the bay of San Francisco, from the relinquishment and grant to the city of San Francisco, California, authorized by the act of Congress approved July 1, 1864, and to designate the said island as so excepted and reserved, and it is ordered that the said island be retained by the United States for military uses.

ANDREW JOHNSON.

DEPARTMENT OF THE INTERIOR,
General Land Office, January 11, 1868.

SIR: Referring to your letter of the 10th instant, in regard to the title of Yerba Buena, or Goat Island, in the bay of San Francisco, California, I have the honor to state that the records of this office show that on 27th January, 1852, Joel S. Polack, Seline Franklin, and Edward Franklin filed their petition with the board of land commissioners for the "island of Yerba Buena, situate in the city and bay of San Francisco, containing five hundred acres or thereabout," claiming under a grant from Governor Alvarado to Juan José Castro, dated November 8, 1838, and that the said board of land commissioners, under date May 22, 1855, confirmed the title of the said Joel S. Polack to "Yerba Buena Island, situate in the bay of San Francisco, opposite the city of San Francisco, with the water for its boundaries." On the 1st June, 1864, the surveyor general was directed to report in regard to the final confirmation, and as no response has as yet been received, that officer was this day telegraphed to *report at once*, and when received you will be promptly advised of the contents.*

I have also to state that the island of Yerba Buena was reserved for "*public uses*" by an order of the President dated November 6, 1850, which order was communicated to the surveyor general June 24, 1851.

Subsequently, at the request of the Secretary of War, the President, on the 12th day of October, 1866, directed the island to be reserved for "*military purposes*," it having been excluded from the relinquishment of lands to the city of San Francisco by the fifth section of the act of Congress approved July 1, 1864, (*Vide* Statutes at Large, vol. 13, page 333,) and accordingly instructions were given to the surveyor general on the 17th of October, 1866, to note on the records of his office the order, and respect it.

I transmit herewith a diagram showing the location of Yerba Buena Island. It is believed that it contains approximately one hundred and sixty acres, yet, as it has never been surveyed by the Government, we have not the area officially reported.

The foregoing is all the information in regard to the matter on file in this office.

I have the honor to be, very respectfully, your obedient servant,

JOS. S. WILSON,
Commissioner.

Hon. J. M. HOWARD,
Chairman of Committee on Pacific Railroad, United States Senate.

DISTRICT OF COLUMBIA, *City and County of Washington, ss:*

John Nye, being first duly sworn, deposes and says that he is acquainted with Thomas H. Dowling, the claimant of the island of Yerba Buena, situate in the bay of San Francisco; that he has been acquainted with said Dowling, and also Gorham H. Nye, from the year 1851, at which time affiant was in California, where affiant has resided for most of the time since that date; that affiant was port warden in the city of San Francisco from the year 1853 to the year 1857; that said Dowling has been in peaceable possession of said island from the time when affiant first became acquainted with him as aforesaid until about the year 1867, when said island, or a portion thereof, was taken possession by and under military authority; that said Dowling claimed possession of said island under a purchase or agreement of purchase from said Gorham H. Nye, whose claim was based upon a certificate or paper which he held, purporting to have been issued by the secretary of Governor Figueras, which paper affiant saw often while in the possession of said Nye, which was until about the year 1853 or 1854, when said Nye surrendered it to said Dowling, in whose possession affiant also saw said paper, but what became of said paper affiant has no knowledge; that the contents of said paper was, as nearly as affiant can remember, that it certified that Gorham H. Nye was the owner of said island, and directing all persons to respect his possession thereof as such. Affiant, however, does not recollect the date of said paper, but the consideration therein expressed was for his (Nye's) services in transporting the body of the late Governor Figueras from Monterey to Santa Barbara; that affiant does not recollect the manner in which island was described, but knows it was the island now called Yerba Buena, or Goat Island, in San Francisco Bay.

Affiant further states that said Gorham H. Nye insisted that his grant was recorded in the Mexican national records or archives, and that affiant went with said Dowling to the keeper of said records in San Francisco, but could find no record of such grant, but was informed that four volumes of such records had been destroyed by fire, and whether the same was contained in the records so destroyed affiant has no knowledge.

---

*January 14, 1868, answered by telegram as follows:

"Yerba Buena Island, rejected March 17, 1858, and motion for reading denied April 11, 1862. Order granting appeal filed August 31, 1867.

"L. UPSON,
"*United States Surveyor.*"

Affiant further states that while said Dowling held possession of said island as aforesaid, he was engaged a part of the time in quarrying rock therefrom, large quantities of which were, as he then understood, for Government purposes, and for which he was paid by the officers of the Government.

Affiant further states that he knows nothing personally of the possession of said island prior to the said year 1851, but he always understood from said Gorham H. Nye and others that he, the said G. H. Nye, had occupied said island from the year 1833 up to the time said Dowling went into possession as aforesaid.

JOHN NYE.

DISTRICT OF COLUMBIA, *County of Washington, ss:*

Personally appeared before me, a notary public in and for the district and county aforesaid, duly qualified to administer oaths, John Nye, who signed the foregoing deposition in my presence, and made oath to the truth of the same.

Witness my hand this 31st day of December, A. D. 1870.

[SEAL.]

FRED'K KOONES,
Notary Public.

DISTRICT OF COLUMBIA, *City and County of Washington, ss:*

Thomas H. Dowling, being first duly sworn, deposes and says that he first went into possession of the island of Yerba Buena, or Goat Island, lying in San Francisco Bay, in the State of California, in the year 1849. That one Gorhan H. Nye had held possession of said island for fourteen years prior thereto, as affiant was credibly informed, and that said Nye claimed to be the owner of said island by virtue of a certificate or grant from Francisco Castello Negrete, late secretary of governor Jose Figuera, deceased, (the said Negrete then the acting governor,) dated in the month of September, 1835; that affiant made a verbal agreement with said Nye for the purchase of said island, and remained in possession of said island under such verbal agreement of purchase until the year 1864, when he completed the performance of the terms of such purchase, and obtained a deed from said Nye for the same; that the said certificate so held by said Nye was written in the Spanish language, and therefore affiant was unable to read the same, he being unacquainted with the Spanish language, but that the said paper was so frequently translated and read to affiant by persons understanding the said language, that the contents of said paper are well recollected by affiant, and that the said paper was in substance as follow:

"This is to certify that Gorham Hyronemo Nye is the owner of Wood Island, one league east of the pueblo of Yerba Buena, in the bay of said pueblo, it being compensation for transporting the body of the deceased governor, Figuera, from Monterey to the cathedral of Santa Barbara, and he is not to be disturbed in the possession thereof."

There were also some words in addition to the above, being directions to the commandant to observe such possession in said Nye, but the language thereof affiant cannot remember. The said certificate was dated in the month of September, 1835, and was signed by Negrete, secretary of the late governor.

Affiant further states that the said Nye delivered to affiant the said paper, as his muniment of title on or about the year 1853 or 1854, and that affiant took the same to Mr. Greenshugh, the land agent for the United States, to settle and adjust claims to lands in California; that the said Greenshugh received and kept the said paper, with others then presented by affiant, but at the same time remarked that there was a claim for said island in favor of Mr. Joel T. Polack, then pending before the commissioner, and which claim he believed would be allowed; that soon after this conversation the said Greenshugh died, and affiant went to the said law agent's office, then in charge of Lewis Blanding, and requested the return to him of said papers; that said Blanding and his clerk spent several days in searching for said paper, but, as they informed affiant and as he believes, the same could not be found, and affiant says he has no further knowledge of said paper; that he has not seen it since the time he delivered it to said Greenshugh, and has no knowledge of its wherabouts.

Affiant further states that the claim of said Polack to said island was confirmed by said commissioners, and that for the purpose of avoiding an apparently adverse title to said island, affiant procured the United States authorities to appeal from such confirmation, which appeal prevailed, and the said claim of Polack was rejected. That on the trial of said cause in said appeal, affiant paid large sums of money in procuring the attendance of witnesses and for other purposes, which expenses the court then sitting refused to charge against the United States, for the reason that such expenses were incurred for affiant's own benefit, and that the United States was not the real party in interest in said suit, but that affiant was the real party in interest therein.

Affiant further states that he remained in the peaceful possession of said island until the year 1867, when the island was taken partial possession of by a small detachment

of soldiers, who have remained quartered on said island, as he believes, ever since, but the tenant of affiant, there in possession of a portion of the said island, has been permitted to remain in such possession.

Affiant further states that there are valuable stone quarries on said island, and that during the possession of affiant as aforesaid he has been engaged in quarrying and selling the stone therefrom, and that during several years of such occupancy he sold annually large quantities of such stone to the United States authorities; that during the said controversy said Polack enjoined the United States officers from paying to affiant for so much of said stone as he had not then been paid for; that such injunction was afterward dissolved, when affiant was paid the amount so enjoined, under orders of Major Z. L. Towers, the said money being paid by William T. Sherman (now General) at the banking house of Lucas, Turner & Co., upon the check of said Towers.

THOMAS H. DOWLING.

Subscribed and sworn to before me this 3d day of January, 1871.

[SEAL.] FREDERICK KOONES,
Notary Public, Washington, D. C.

Jacob P. Leese, being first duly sworn, was examined before the Committee on Public Lands, and made the following statement: I am well acquainted with Gorham H. Nye, the former owner of Yerba Buena, or Goat Island; I first became acquainted with him in the year of 1834, when he was in command of the brig Avon at Monterey; the next time I saw him was likewise in Monterey, in command of the said brig Avon, in the fall of 1835, when he embarked the body of the deceased Governor José Figueras on board of the said brig from the capital of Monterey to the cathedral of St. Barbara, where the body was deposited.

Question. How long have you resided in California?—Answer. I resided in Upper California since the year 1833, and settled in Yerba Buena in July, 1836, and remained there until August, 1841, when I sold out my mercantile establishment to the Hudson's Bay Company, then settled in Sonoma, and remained there until December, 1848, and established myself in Monterey, where I resided with my family up to the present time, and being well acquainted with all the authorities and also well identified in general with all the proceedings of the country.

JACOB P. LEESE.

In the district court, fifteenth judicial district.

THOMAS H. DOWLING, plaintiff,
vs.
B. S. BROOKS, Sr., B. S. BROOKS, Jr., JOHN GREEN, John Scott, and Mike Higgins, defendants.

STATE OF CALIFORNIA, *County and City of San Francisco, ss:*

Thomas H. Dowling, the above-named plaintiff, complains of B. S. Brooks, sr., B. S. Brooks, jr., John Green, John Scott, and Mike Higgins, the above-named defendants, and for his cause of complaint alleges as follows:

The said plaintiff alleges that in the year 1849 he entered upon, became the owner, and took possession of that certain tract of land known as Yerba Buena, or Goat Island, situate in the bay of San Francisco, in said county of San Francisco, and remained in the lawful and peaceable possession and occupancy of said island until the commission of the wrongs and trespass by the said defendants as hereinafter mentioned. The said plaintiff further alleges that he was the owner of and in the quiet possession of said island, and was entitled to the possession thereof, and was residing thereon with his family, and claimed and held said island as his homestead property, and that which he so occupied and was entitled to the possession of said island, they, said defendants, in the night time on the night of the 14th day of March, in the year 1866, forcibly and without authority entered upon said island, and with force and violence wrongfully and unlawfully tore down and destroyed the dwelling-house of said plaintiff, wherein his family then resided, and wrongfully, forcibly, and unlawfully took and ejected from said dwelling-house the members of plaintiff's family, to wit, his son and daughter, then occupying the same as plaintiff's homestead, and with force and violence took and compelled the said members of plaintiff's family to go aboard a boat for that purpose used by the said defendants, and were, by the said defendants, with force and violence, wrongfully and unlawfully taken away from said island.

The plaintiff says further that said island is of great value by reason of the extensive quarries of stone thereon, and that at the time of the wrongs and injuries by the defendants committed as aforesaid, was for the supply of building material for houses in the city of San Francisco, and the paving of streets, of the value of $500,000. That said defendants on the 14th day of March, 1866, as aforesaid, wrongfully, unlawfully, and forcibly ejected the said plaintiff from said island, thereby denying and depriving the plaintiff of the power to work said stone quarries, whereby said defendants have damaged plaintiff to the amount of $20,000.

Said plaintiff alleges that said defendants on the 14th day of March, 1867, as aforesaid, wrongfully and unlawfully destroyed the residence of the said plaintiff, and ejected him and his family therefrom, the said property so destroyed by the defendants being at that time occupied and claimed by the plaintiff and his family as a homestead, whereby the plaintiff was injured and damaged to the sum of $5,000.

In consideration of which wrongs and injuries by the said defendants committed as aforesaid, the plaintiff brings this action, and prays that he may have judgment against said defendants for the sum of $25,600, and his costs in this behalf expended.

G. D. HALL & W. W. DRUMMOND,
Attorneys for Plaintiff.

STATE OF CALIFORNIA, *San Francisco County, ss:*

Before me, the undersigned, this 15th day of March, 1867, personally came Thomas H. Dowling, plaintiff named in the foregoing complaint, who, being sworn, says he has heard said complaint read, and that the matters and things therein mentioned are true of his own knowledge, except those matters stated upon information and belief, and, as to those, he believes it to be true.

THOS. H. DOWLING.

Subscribed and sworn to before me the day and date above written.

G. C. LETCHER,
Deputy County Clerk.

I, Washington Bartlett, county clerk of the city and county of San Francisco, State of California, and ex-officio clerk of the fifteenth district court in and for said city and county, hereby certify the foregoing to be a full and true copy of the original complaint in the above-entitled action, filed in my office on the 13th day of March, A. D. 1867.

Attest my hand and seal of said court, this 8th day of July, A. D. 1869.

[SEAL.] WASHINGTON BARTLETT, *Clerk.*
By BEN. MORGAN, *Deputy Clerk.*

In the district court of the fourth judicial district.

JOHN V. WATTSON, plaintiff,
vs.
THOMAS H. DOWLING, defendant.

STATE OF CALIFORNIA, *City and County of San Francisco, ss:*

The above-named plaintiff, a resident of said city and county of San Francisco, complains of the said defendant, a resident of the same place, and for cause of action says:

That heretofore, to wit: on the 16th day of November, A. D. 1858, the said plaintiff was and for a long time prior thereto, at said city and county, had been seized, possessed, and the owner of the following tract or parcel of land, situate, lying, and being in said city and county of San Francisco, and bounded and described as follows, to wit: being a portion of the island of Yerba Buena, commencing from a stake in the eastern sand beach known as Jenning's stake or boundary; thence running in a northwesterly direction 18 chains to a stake in the western side of said island known as Jenning's stake; thence bounded on the northwest, west, south, and east, to the place of beginning by the low-water mark on the beach of said island, containing one hundred and three acres and three roods.

And the said plaintiff, from the day and year last aforesaid, has been and now is the owner of all and singular the said premises and entitled to the possession thereof.

And said plaintiff, being then and there seized and possessed of said tract or parcel of land as aforesaid, the said defendant afterwards, to wit, on the 28th day of January, A. D. 1859, unlawfully entered into and upon said premises, and with force and arms ejected therefrom the said plaintiff, and the said defendant has ever since wrongfully and unlawfully withheld, and now wrongfully and unlawfully withholds, the possession of said premises from said plaintiff, to the great damage of said plaintiff, to wit, in the sum of $2,000.

And plaintiff, for another and further cause of action against said defendant, says that said defendant heretofore, to wit, on the day and year and at the place aforesaid, with force and arms and violence broke and entered that certain messuage and premises of the said plaintiff, being the same in the first count of this complaint described, situate in the said city and county of San Francisco, and ejected, expelled, put out, and moved the said plaintiff from his possession and occupation thereof, and kept and continued him so expelled and amoved for a long space of time, to wit, from the day and year aforesaid, hitherto and still keeps the said plaintiff so expelled, put out, and amoved, and during all that time the said defendant took and had and received to the use of him, the said defendant, all the issues and profits of said tenements and premises, being of great monthly value, to wit, of the monthly value of $200, whereby the said plaintiff, during all the time aforesaid, not only lost the issues and profits of said lands, tenements, and premises, with the appurtenances, but was deprived of the use and occupation of the same, to the damage of the plaintiff in the sum of $2,000.

Wherefore the plaintiff brings this suit, and prays he may have and recover from the said defendant the said premises and the possession thereof and his damages aforesaid for the withholding thereof, to wit, the sum of $2,000, and also his costs in this behalf sustained.

McDOUGALL & SHARP,
Plaintiff's Attorneys.

STATE OF CALIFORNIA, *City and County of San Francisco, ss:*

John V. Wattson, of lawful age, being duly sworn, deposes and says that he is the plaintiff in the above-entitled action; that the foregoing complaint is true of his own knowledge except as to the matters which are therein stated on information and belief, and as to those matters that he believes it to be true.

JNO. V. WATTSON.

Subscribed and sworn to before me this 5th day of May, A. D. 1859.

J. B. McMINN,
Deputy County Clerk.

(Indorsed:) Complaint. Filed May 5, 1859. Wm. Duer, clerk, per Beverly C. Duer, deputy clerk.

In the district court of the fourth judicial district of the State of California, in and for the city and county of San Francisco.

JOHN V. WATTSON, plaintiff,
vs.
THOMAS H. DOWLING, defendant.

Action brought in the district court of the fourth judicial district of the State of California, in and for the city and county of San Francisco, and the complaint filed in said city and county of San Francisco, in the office of the clerk of said district court

The people of the State of California send greeting to Thomas H. Dowling, defendant:

You are hereby required to appear in an action brought against you by the above-named plaintiff in the district court of the fourth judicial district of the State of California, in and for the city and county of San Francisco, and to answer the complaint filed therein within ten days (exclusive of the day of service) after the service on you of this summons, if served within this county; or, if served out of this county, but in this district, within twenty days; otherwise, within forty days, or judgment by default will be taken against you, according to the prayer of said complaint.

The said action is brought to recover a judgment in favor of said plaintiff against you for the possession of certain premises claimed by the plaintiff and alleged to be wrongfully withheld by defendant, together with the sum of $2,000 damages for such detention and for costs of suit, as particularly set out in plaintiff's complaint.

And you are hereby notified, that if you fail to appear and answer the said complaint as above required, the said plaintiff will apply to the court for the relief demanded in his said complaint.

Given under my hand and the seal of the district court of the fourth judicial district of the State of California, in and for the city and county of San Francisco, this 5th day of May, in the year of our Lord one thousand eight hundred and fifty-nine.

[SEAL.]

WM. DUER, *Clerk.*
By CHAS. S. CAPP,
Deputy Clerk.

OFFICE OF THE SHERIFF OF THE CITY AND COUNTY OF SAN FRANCISCO.

I hereby certify that I received the within summons on the 6th day of May, A. D. 1859, and personally served the same on the 14th day of May, A. D. 1859, upon Thomas H. Dowling, the within defendant, by delivering to the said defendant personally, in the city and county of San Francisco, a copy of said summons, attached to a certified copy of the complaint.

Dated at San Francisco this 14th day of May, 1859.

CHARLES DOANE, *Sheriff.*
By WM. H. SILVERTHORN,
Deputy Sheriff.

(Indorsed:) Filed this twenty-third day of May, A. D. 1859. William Duer, clerk, by Chas. S. Capp, deputy clerk.

In the district court, fourth judicial district.

JOHN V. WATTSON
vs.
THOMAS H. DOWLING.

The defendant comes and for answer to plaintiff's complaint, shows:

1. That he denies each and every allegation in the first count of the complaint.
2. That he denies each and every allegation in the second count of the complaint.
3. That on the day of seizure alleged in the complaint, to wit, the 16th day of November, A. D. 1858, and a long time prior thereto, the premises described therein were occupied and possessed by defendant with his family, as a homestead, of which plaintiff had due notice.

Wherefore he demands judgment and his costs in this behalf expended.

WM. BLANDING,
Defendant's Attorney.

STATE OF CALIFORNIA, *City and County of San Francisco:*

Personally appeared before me Thomas H. Dowling, and made oath that he is the defendant in this action; that the foregoing answer is true of his own knowledge, except as to the matters which are therein stated on his information or belief, and as to those matters that he believes it to be true.

THOMAS H. DOWLING.

Subscribed and sworn to before me this 21st day of May, 1859.

J. B. McMINN,
Deputy County Clerk.

(Indorsed:) "Answer." Filed May 21, 1859. Wm. Duer, clerk; Beverly C. Duer, deputy clerk.

In the district court of the fourth judicial district of the State of California, in and for the city and county of San Francisco.

JOHN V. WATTSON
vs.
THOMAS H. DOWLING.

Judgment rendered July 15, A. D. 1859. Register No. 7,553.

This cause came on regularly for trial in its order upon the calendar.

S. A. Sharp appeared as attorney for the plaintiff, and William Blanding, esq., for defendant.

The following persons, to wit, George Hager, S. A. Metcalf, S. Dick, J. A. Banks, J. L. Cole, R. Clark, J. Damon, E. Ellery, J. Daly, H. Doscher, C. Mercer, and T. J. Hall, were duly impaneled, accepted, and sworn as the jury to try this cause, whereupon John McDougall, a witness for the plaintiff, and Charles H. Kohler and Edmund D. Cox, witnesses for the defendant, were duly sworn and examined, and after hearing the arguments of counsel for the respective parties and the charge of the court, the jury retired to deliberate upon their verdict, and subsequently returning into court, said they found for the defendant.

Wherefore, by virtue of the law, and by reason of the premises and verdict aforesaid, it is ordered, adjudged, and decreed, that John V. Wattson, plaintiff, do take

nothing by this action as against said defendant, Thomas H. Dowling; but that said defendant, Thomas H. Dowling, do have and recover of and from John V. Wattson, plaintiff, his costs and disbursements incurred in this action, amounting to the sum of $59 50.

Judgment entered July 16th, 1859.

(Indorsed:) Judgment rolls. Filed July 16th, A. D. 1859. W'm Duer, clerk, by Cha's S. Capp, deputy clerk.

In the district court of the fourth judicial district of the State of California, in and for the city and county of San Francisco.

JOHN V. WATTSON, plaintiff,
vs.
THOMAS H. DOWLING, defendant. } No. 7,553.

I, Washington Bartlett, county clerk of the city and county of San Francisco, and ex-officio clerk of the district court of the fourth judicial district of the State of California, in and for the city and county of San Francisco, do hereby certify the foregoing to be a full, true, and correct copy of the original judgment roll in the above-entitled cause, which I have caused to be exemplified according to the act of Congress.

In witness whereof I have hereunto set my hand and affixed the seal of said court this 1st day of July, A. D. 1869.

[SEAL.]

WASHINGTON BARTLETT,
County Clerk, and ex-officio Clerk of the District Court of the 4th Judicial District.

In the district court of the fourth judicial district of the State of California, in and for the city and county of San Francisco.

JOHN V. WATTSON, plaintiff,
vs.
THOMAS H. DOWLING, defendant. } No. 7,553.

I, E. D. Sawyer, sole judge of the district court of the fourth judicial district of the State of California, in and for the city and county of San Francisco, do hereby certify that said court is a court of record, having a clerk and seal. That Washington Bartlett, who has signed the annexed attestation, is the duly elected and qualified county clerk of the city and county of San Francisco, and was, at the time of signing said attestation, ex-officio clerk of said district court. That said signature is his genuine handwriting, and that all his official acts as such clerk are entitled to full faith and credit. And I further certify that said attestation is in due form of law.

Witness my hand this 1st day of July, A. D. 1869.

E. D. SAWYER,
Judge of the District Court of the 4th Judicial District of the State of California, in and for the City and County of San Francisco.

STATE AND DISTRICT OF CALIFORNIA, *City and County of San Francisco:*

Paula Valencia being duly sworn, deposes and says:

Question. Did you know Gorham H. Nye?—Answer. Yes, many years ago, before I was married, which was between thirty and forty years ago, when he was captain of a trading vessel.

Q. Where did he live after he left his vessel?—A. After he left his vessel he lived part of the time in Yerba Buena and part of the time on Yerba Buena Island, where he had a party of kanakas and goats. I often stopped at the island in crossing the bay.

Q. How long did he live on the island, so far as you know?—A. He commenced to live there in the year 1833 or 1834; and the reason why we used to stop at the island was that there were breakers on the beach at Yerba Buena, so that it was smoother for the launch at the island.

Q. How late a date do you remember the captain living on the island?—A. I do not know, certain; I was living at the Mission Dolores, and only saw the captain when he visited me at the Mission.

Q. Is this Yerba Buena Island the island formerly occupied by Captain Nye?—A. Yes, it is the same island; but after he put the goats on it we used to call it Goat Island, and is the same island now claimed by Captain Thomas H. Dowling.

[SEAL.] PAULA VALENCIA.

Subscribed and sworn to before me this 24th day of September, 1868.

H. F. LARDNER,
United States Commissioner.

STATE OF CALIFORNIA, *City and County of San Francisco:*

Thomas H. Dowling, of Yerba Buena, or Goat Island, being duly sworn, deposes and says that he is the rightful and lawful owner of the island of Yerba Buena, by quit-claim deed from one Gorham H. Nye, and duly recorded; and that he was unlawfully ejected from the said island by General McDowell, purporting to act under authority from the United States; and that he, Dowling, has had a bill introduced in Congress, asking for the confirmation of his claim; and pending the examination by Committee on Public Lands, he most respectfully protests against any action being taken granting to the Western Pacific Railroad Company any portion of the aforesaid island until his claim to the same be finally settled.

THOMAS H. DOWLING.

True copy:

N. CALLAN, *Notary Public.*

(Original filed in the Committee on the Public Lands in the Senate of the United States.)

Deed.—Gorham H. Nye to Thomas H. Dowling.

This indenture, made the twenty-second day of December, in the year of our Lord one thousand eight hundred and sixty-four, between Gorham H. Nye, of the city and county of San Francisco, in the State of California, party of the first part, and Thomas H. Dowling, of the same place, party of the second part, witnesseth that the said party of the first part, for and in consideration of the sum of five hundred dollars, lawful money of the United States of America, to him in hand paid by the said party of the second part, at or before the ensealing and delivery of these presents, the receipt whereof is hereby acknowledged, hath remised, released, and quit-claimed, and by these presents doth remise, release, and quit-claim unto the said party of the second part all his right, title, and interest of, in, and to all that certain piece, or parcel, or tract of land in said city and county, and known as Yerba Buena Island, situate, lying, and being in the bay of San Francisco, about two miles in an easterly direction from the custom-house in said San Francisco, containing about one hundred and sixty acres, more or less.

Together with all and singular the tenements, hereditaments, and appurtenances hereunto belonging or in any wise appertaining, and the reversion and reversions, remainder and remainders, rents, issues, and profits thereof, and also all the estate, right, title, interest, property, possession, claim, and demand whatsoever, as well in law as in equity of the said party of the first part of, in, or to the above-described premises and every part and parcel thereof, with the appurtenances.

To have and to hold all and singular the above-mentioned and described premises, together with the appurtenances, unto the said party of the second part, his heirs and assigns, forever.

In witness whereof, said party of the first part hath hereunto set his hand and seal the day and year first above written.

[SEAL.] GORHAM H. NYE.

Signed, sealed, and delivered in the presence of—

STATE OF CALIFORNIA, *City and County of San Francisco, ss:*

On this twenty-third day of December, A. D. one thousand eight hundred and sixty-four, before me, George T. Knox, a notary public in and for said city and county, duly commissioned and sworn, personally appeared the within-named Gorham H. Nye, whose name is subscribed to the annexed instrument as a party thereto, personally known to me to be the individual described in and who executed the said annexed instrument, and he acknowledged to me that he executed the same freely and voluntarily, and for the uses and purposes therein mentioned.

In witness whereof I have hereunto set my hand and affixed my official seal, at my office in said city and county, the day and year last above written.

[SEAL.] GEORGE T. KNOX, *Notary Public.*

A true copy of the original, recorded at request of T. H. Dowling, December 22, 1864, at two minutes past 3 o'clock p. m.

T. YOUNG, *County Recorder.*

STATE OF CALIFORNIA, *City and County of San Francisco, ss:*

I, William L. Higgins, county recorder in and for the city and county of San Francisco, do hereby certify that the annexed is a full, true, and correct copy of an original deed, as will appear by reference to Book 269 of Deeds, page 116, now in my office.

In testimony whereof I have hereunto set my hand and affixed my official seal this 31st day of January, A. D. 1870.

[SEAL.] WILLIAM L. HIGGINS, *County Recorder.*

Per G. M. BERRY, *Chief Deputy.*

In the district court of the fifteenth judicial district of the State of California, in and for the city and county of San Francisco.

THOMAS H. DOWLING, plaintiff,
vs.
B. S. BROOKS, B. H. BROOKS, JOHN GREEN, John Scott, Mike Higgins, and John Doe and Richard Roe, whose real names are unknown to the plaintiff, defendants.

Amended complaint filed by leave of the court.

The amended complaint of the above-named plaintiff shows to this court that on the 14th day of March, 1866, at the said city and county, the defendants above named unlawfully entered and broke in and upon the plaintiff's farm and house, situate in the city and county of San Francisco, and State of California, and known as "Yerba Buena," sometimes called Goat Island, which island is bounded on all sides by the waters of the bay of San Francisco; that after said defendants had so entered, they cut down the plaintiff's house and trod down the grass, and otherwise injured the same, and against the will of the plaintiff unlawfully took the possession thereof from the plaintiff, and still unlawfully withhold the possession thereof from the plaintiff, to his damage in the sum of $25,000.

Wherefore plaintiff demands judgment against the defendants for the sum of $25,000 damages, and that they be required to surrender to the plaintiff the possession of said premises, and for such other relief as he may be entitled, together with the costs of this action.

G. T. & WILLIAM H. SHARP,
Attorneys for Plaintiff.

CITY AND COUNTY OF SAN FRANCISCO, *ss:*

Thomas H. Dowling, being duly sworn, deposes and says that he is the plaintiff in the above-entitled action; that he has read the foregoing complaint, and knows the contents thereof; and that the same is true of his own knowledge, except those matters therein stated on his information or belief, and as to those matters he believes it to be true.

THOMAS H. DOWLING.

Subscribed and sworn to before me this 27th day of September, 1867.

R. P. LEWIS,
Notary Public.

I, Washington Bartlett, county clerk of the city and county of San Francisco, State of California, and ex-officio clerk of the fifteenth district court in and for said city and county, hereby certify the foregoing to be a full and true copy of the original complaint in the above-entitled action, filed in my office on the 27th day of September, A. D. 1867.

Attest my hand and seal of said court, this 25th day of June, A. D. 1869.

[SEAL.] WASHINGTON BARTLETT, *Clerk.*
By BEN MORGAN, *Deputy Clerk.*

DISTRICT OF COLUMBIA, *City and County of Washington, ss:*

Edward McGowan, being duly sworn, deposes and says, in addition to and reference being made to affiant's affidavit of the 2d of May, 1868, in this cause, that upon the trial before affiant, referred to in said affidavit, objection was made by defendant in said suit to the title of plaintiff, Thomas H. Dowling, to the said island of Yerba Buena; whereupon said Dowling produced in evidence a certificate dated in September, 1835, from the secretary of Governor Figueras, then lately deceased, which certificate certified in substance that Gorham Hyronemo Nye was the owner of Wood Island, one league distant from the pueblo of Yerba Buena, in the bay of said pueblo, the same being compensation for transporting the body of the deceased Governor Figueras from Monterey to Santa Barbara, and assured to him the full possession of the same.

Affiant further states that the place called Wood Island in said certificate was well understood, and shown and proved upon said trial, to be the island called at a later date and now known as Yerba Buena, or Goat Island.

Affiant further states that the reasons why the contents of said certificate are so well fixed in affiant's mind are that the said certificate and its admissibility as evidence was fully discussed at the time by able counsel, who occupied several hours in such discussion, during which time affiant critically examined the same, for the purpose of rendering his decision and charging the jury thereupon.

EDWD. McGOWAN.

Sworn and subscribed before me this 20th day of January, A. D. 1871.

[SEAL.] N. CALLAN,
Notary Public.

UNITED STATES OF AMERICA,
District and State of California, City and County of San Francisco, ss:

John Tripp, being duly sworn, deposes that he has been a resident of the city and county of San Francisco, State of California, for over six years last past; that he is acquainted with Captain Thomas H. Dowling, of the said city and county; has been acquainted with him for about five years last past; that he knows the island which is sometimes called Goat Island, and sometimes called Yerba Buena Island. Said island lies in the bay of San Francisco, about two miles easterly from the front of the city of San Francisco. Deponent worked on said island for a tenant of said Dowling nearly five years ago; that deponent worked there over twelve months, superintending the workmen of said tenant. Deponent knows that of the tide lands adjoining upon and connected with said island, said Dowling filled up and made dry land of about from two and a half to three acres, which is a valuable improvement. That the cost of said filling up of said tide lands would be about $250,000. That deponent would not take the job to fill in one acre there for less than $1,000,000. Deponent knows that said Dowling had other improvements on said island, such as several houses and out-houses, and cultivated lands; that afterward, to wit, in the year 1866, deponent did other work on said island, making an embankment. Deponent was then engaged by said Dowling as superintendent on said work. Deponent says that in his judgment said Dowling has lost over one million of dollars by being expelled from said island.

JOHN TRIPP.

Subscribed and sworn to before me this 10th day of November, A. D. 1868.

H. F. LARDNER,
Commissioner United States Court, District of California.

41ST CONGRESS, 3d Session. } HOUSE OF REPRESENTATIVES. { REPORT No. 51.

CONTRACTS IN THE TREASURY DEPARTMENT.

MARCH 3, 1871.—Ordered to be printed and recommitted.

Mr. CHURCHILL, from the Committee on Expenditures on the Public Buildings, made the following

REPORT.

The Committee on Expenditures on the Public Buildings, who were instructed by the House, upon the resolution offered by Mr. Schenck March 21, 1870, *"to investigate the manner in which expenditures are made on public buildings, particularly those under the direction of the Supervising Architect of the Treasury Department, and that they also inquire into the manner in which he has conducted his office, and to report by bill or otherwise," report:*

That in the discharge of the duties with which they were charged by the House they have taken a considerable amount of testimony bearing upon the subjects investigated, which they herewith report. In selecting subjects for their investigation, the committee have taken for the most part those to which their attention was directed by charges made to them against the management of the Supervising Architect of the Treasury with respect thereto. So far as those charges related to the post offices in process of erection in New York and Boston and contracts connected therewith, the committee found that they had been examined at length by the Committee on Post Offices and Post Roads, and that subsequent to the adoption of the above-mentioned resolution that committee had submitted majority and minority reports to the House, with the very voluminous testimony taken by them, whereby the case, with respect to these buildings, had been so fully presented that the committee have not deemed it necessary to repeat or extend the investigation, so far as these buildings are concerned.

One of the first subjects to which the attention of the committee was directed was the custom-house and post office in process of erection at St. Paul, Minnesota. Persons residing at St. Paul charged, although parties at that place desired and asked, and had been promised by the Supervising Architect, an opportunity to bid for the furnishing of granite for that building, that without advertising or notice to these parties of any kind, a contract for the granite required was closed at a much higher price than these parties would have been willing to have furnished the same for. It was further charged that after a contract had been entered into with a firm to cut the granite to be used in the building, the parties to this contract were allowed to give it up, and then to carry on the work by the day for the Government at a greatly increased expense; that the work done by the day was intentionally made needlessly expensive, so as to pave the way for a new contract at a greatly increased rate; and that such contract was entered into to the great disadvantage of the Government. The committee have taken evidence

upon these subjects, and find the following to be substantially the facts in the case:

The custom-house at St. Paul is built of the St. Paul limestone, with dressings of granite. Work upon the foundation of the building was commenced in September of 1867 under the superintendence of A. F. Knight, esq., an architect by profession, residing in St. Paul, and who was appointed upon the recommendation of Senator Ramsey and others.

During the following winter, it appears from the evidence, at least five or six persons informed the superintendent of their wish to put in proposals for furnishing granite. One of these, T. M. Newson, esq., in February, 1868, wrote to the Supervising Architect at Washington, who replied as follows:

TREASURY DEPARTMENT, *February* 25, 1868.

SIR: Yours of the 18th instant is received. In reply I have to say that the new custom-house at St. Paul will be constructed of the Minnesota limestone, with dressings of granite, for which a large quantity of stone will be required.

Advertisements requesting proposals for furnishing the same will be duly published by the superintendent, and I shall be much pleased to have you submit a bid.

If you are the lowest bidder, and the security and sample of stone are satisfactory, the contract will be awarded to you.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

T. M. NEWSON, Esq.,
St. Paul, Minnesota.

With the opening of the spring and of the season for commencing work upon the building, the Supervising Architect, in repeated letters, urged upon the superintendent to obtain as soon as possible proposals for furnishing granite, so that a contract might be entered into and work commenced.

From these letters, as well as from previous correspondence, it would appear that the Supervising Architect expected the superintendent to advertise for proposals in accordance with the rules and custom of the Department. Instead of doing so, Knight, without advertising, and after advising with only two of the parties who had spoken to him on the subject, one of whom had already informed him that he had sold his quarry and gone into other business, closed a bargain with the other, F. R. Delano, esq., at 65 cents per cubic foot for dimension granite of all sizes, delivered at the custom-house site.

This contract was approved by the Supervising Architect, and under it all the granite used in the building, amounting to about $16,000, has been furnished. The evidence abundantly shows, in the judgment of the committee, that the contract was in fact a favorable one for the Government; that the contractors lost money by the contract, and that the granite could not have been furnished at a less price by any of the parties wishing to bid, without a loss to the contractor. They think, however, that the manner in which the contract was entered into was an improvident one, and that it was unjust, both to the Government and to other parties, not to have given them an opportunity to have put in proposals, and that the fact that the Government did not lose by the contract was owing rather to the ignorance or inexperience of the contractor, of the cost of getting out granite, than to any good management on the part of the superintendent in charge of the work. The committee are rather impressed with this idea, from the fact that similar management seems to have prevailed in other matters. In procuring the limestone for the walls, although the city is underlaid with that material, the stone was

first procured by leasing a quarry from one William F. Davidson, and after working it for some time a contract was entered into with the same person to furnish the balance of the limestone needed, at 35 cents per cubic foot, but neither in making the lease nor the subsequent contract does any opportunity appear to have been given to other parties to make proposals for furnishing the Government with this material.

The contract for cutting the granite, after advertisements for proposals in the newspapers both at St. Paul and Washington, was first entered into with John Stuart & Co., at Washington, who went to St. Paul to do the work. Their original proposal was, to do the work for $86,794 51, but by their contract they agreed to do it for $66,955 68. The granite proved to be harder and more difficult to work than had been anticipated, and the contractors found themselves embarrassed by the eight-hour law of Congress, and after laboring until their work amounted to $6,464 90 they abandoned the contract. As they were the only available granite-cutters in Minnesota, and the Government was very anxious for the work to proceed, their abandonment of the contract was assented to on the part of the Government, and the same workmen were employed by the day to continue the cutting. This was continued until $19,923 77 had been expended in this way, when, finding it much more expensive than had been anticipated, a contract was entered into with A. H. Wilder to finish the work, at a price which would make the cutting of the granite for the whole building amount to $105,494 60. Although this is a very large advance upon the original bid, and still larger upon the contract price with John Stuart & Co., the committee have failed to discover any evidence that any improper motive influenced either the Supervising Architect or the superintendent to make this contract, or that the contract was sufficiently profitable to furnish any ground to suspect fraud in its being entered into. Granite-cutters seem to have been rare in Minnesota, and to have commanded high wages for their labor; the stone was a difficult one to work, and the drawings and photographs of the work presented to the committee showed that the work was so elaborate that they could easily believe the testimony of the contractor, who was examined by them, that the contract had given him only an ordinary living profit. The evidence before the committee showed that the cost of dressing and putting in place the granite used in building the Boston post office was about twice that of the stone as delivered at the building, while in St. Paul it was more than six times as great. It may well be doubted whether it was wise to have adopted in this building a style and degree of ornamentation sufficient for one erected at the most conspicuous point in the whole country, and whereby, with other causes, the expense has been increased from $173,335, the original estimate, to $379,000, the amount now estimated as necessary, with what has been already expended, to complete the building.

The correspondence, a part of which is presented herewith, shows that the Supervising Architect was constantly urging the superintendent of the building to greater energy in the prosecution of the work, and to economy in its management; and the photographic views of the building presented to the committee, with the evidence, show that the work has been very thoroughly, substantially, and elegantly done, and that the Government will have a building, when completed, which will, it is true, have cost nearly twice the original estimate, but which will be an ornament to St. Paul and a credit to the Government, and which will fairly represent the money expended upon it by the Government.

While the committee cannot approve the management of the superintendent, and think the building should have been built upon a plan

involving less expense, they have been unable to find evidence of any fraudulent action with respect to it upon the part of the Supervising Architect of the Treasury.

Another subject to which the attention of the committee was called, was that of the workshops and photographic establishment under the direction of the Supervising Architect. With respect to these it was alleged that the work done at them was much more expensive than the same could be procured for by contract or purchase in open market; and, also, that work was done at them for private individuals, and that large amounts of the latter had not been paid for by the persons for whom it was done. The committee examined these establishments, and found that the force employed in the workshops had been very materially reduced. They found that it was true that work had been done for private parties at these establishments, and by the men there employed, during the last administration; but that soon after the present Secretary of the Treasury entered upon the duties of his office, by his order the practice was stopped. The amount of work done at the Treasury workshops for private parties, and the persons for whom it was done, will appear from the following statement furnished to the committee; from which it will also appear that the same has been paid for, with very trifling exceptions, although a considerable part was not paid for until after the committee commenced its investigations.

Statement of work done in the workshops of the Treasury extension for private parties, as it appears from the books of the Treasury extension, since the date of appointment of A. B. Mullett, esq., as Supervising Architect, the amounts charged for the same, and how and when paid.

No.	Name.	Dates at which work was performed.	Nature of the work.	Amount charged.	How paid.	When paid.	Amount.	Balance due.

						April 6, 1869	69 94	
						June 27, 1870	3,236 35	
							7,826 09	Do.

As to the greater expense of furniture made at these workshops, as compared with that made by contract or bought in open market, it is claimed that the greater durability of the former more than compensates for this increased expense. To show this, the following statement was prepared and submitted to the committee, and its accuracy sworn to by the assistant superintendent of work at the Treasury buildings:

Statement in regard to the furniture made in the cabinet shop connected with the Treasury extension, viz:

1st. One desk for Third Auditor, November 29, 1867, $119 37.—This was a large book and file case, 13 feet 6 inches by 11 feet 6 inches, for room 55 of the Third Auditor's Office. The file case, fitted up with pigeon holes, which required a large amount of additional labor and material, and adds not less than twenty per cent. to the cost of an ordinary book-case. This case was made of solid mahogany and in the very best manner, and is now in as good condition as when first constructed.

2d. Two desks for Secretary's Office, January 4. 1869, $322 43 each.—These were two large double standing desks for four clerks, with rollers for books, &c., made under special instructions and of the best mahogany, or, in other words, double the number of desks stated by Mr. Oertly.

3d. Two desks for Architect's Office, $330 57 each.—These were two large double desks for four clerks, or for twice as many single desks as were given by Mr. Oertly.

4th. Two standing desks for Fourth Auditor, $500 12½ each.—These were two double standing desks for Fourth Auditor, one side 13 feet, and the other 17 feet 3 inches long; the peculiar nature of the business for which they are used requiring desks of this size. They would give ample accommodation for seven clerks engaged in ordinary business.

5th. One walnut book-case for Light-house Board.—This was a walnut desk and file case combined, and of a special finish.

6th. One mahogany book-case for Treasurer, $849 33.—This was a large book and file case, 10 feet 4 inches by 13 feet, fitted with pigeon-holes, which, as before said, largely increases the cost of such a piece of furniture over one fitted up in the ordinary manner, with the same external appearance.

7th. One case for Fourth Auditor, $4,098 56.—This covers four cases for Fourth Auditor's Office, 20 feet 6 inches long by 13 feet high, two being placed back to back between doors 27 and 29, and two between doors 23 and 25, first floor, each case being fitted up with pigeon-holes and shelves for books, thus making four cases instead of one, as stated by Mr. Oertly.

8th. One case for Fourth Auditor, $1,182 91.—This case covers the entire superficial area of one end of a room 20 feet 6 inches long by 13 feet high, fitted up with pigeon-holes and shelves.

9th. One case and desk for Fourth Auditor, $1,104 70.—This is also a case covering the side of a room 20 feet 6 inches long by 13 feet high. This case has about the double depth of any of the other cases.

10th. One case, $913 75.—This is the case for the warrant room, 20 feet 6 inches long and 13 feet high, of solid mahogany, fitted up with pigeon-holes and shelves. This case has been made over two years ago, and removed from another room to the present place, and is in excellent condition.

All of the furniture specified above is made of the very best quality of seasoned mahogany lumber, and in the best manner. Though much of it was made some years ago, and exposed to the dry heat of the Treasury building, it is all now in practically as good condition as when first constructed, and will last many years. I now desire to call your special attention to the furniture made under contract for the Treasury Department, of which a great part was ordered and paid through Mr. Oertly during the time he was in charge of the office of Supervising Architect. But few of the articles remain in the building, most of them having become entirely useless and been removed. Of those that remain I will mention the following:

1865.—Book-case for Register's Office, 11 by 15 feet, made of cherry, without pigeon-holes, cost $650, or at the rate of $4 17 per superficial foot. The doors are badly shrunk, locks out of order, and the case generally in bad condition.

A solid mahogany case, 12 by 20 feet, of same construction, made in Treasury extension shops for Comptroller of the Currency, cost $961 52, at the rate of $4 06 per superficial foot.

1866.—A second case of same material and construction for Register's Office, 11 by 12 feet, cost $650, or at the rate of $4 92 per superficial foot. Treasury extension case, of same kind, for Register's Office. 12 by 12, sash doors, and of solid mahogany, cost $611, at the rate of $4 24 per superficial foot.

1866.—Two book-cases of ash, 11 by 12 feet, for Register's Office, cost $1,000, at the rate of $3 78 per superficial foot. One of which cases has pigeon-holes. Both of

these cases are in very bad condition; doors do not fit and the locks are out of order.

Similar case, of solid mahogany, made at Treasury extension shops, for warrant room, at a cost of $913 75, at the rate of $3 70 per superficial foot.

1866.—Two double cases of pine for Light-house Board, partly full of pigeon-holes, under contract with A. Grant, cost $2,430 70, or at the rate of $3 39 per superficial foot. Vouchers for these cases certified to by Mr. Oertly. These cases are now entirely worthless.

One double ash case, full of pigeon-holes, made in Treasury extension shops for Solicitor's Office, 12 by 40, cost $1,609 42, at the rate of $3 36 per superficial foot.

Two mahogany cases, made by E. H. King, for Commissioner of Customs, 13 feet by 14 feet 3 inches each, cost for both $2,012 24, with pigeon-holes, at the rate of $5 43 per superficial foot.

One book and file case of mahogany for Third Auditor's Office, 11 feet 6 inches by 13 feet six inches, with pigeon-holes, made in the shops of the Treasury extension, at the cost of $719 37, at the rate of $4 74 per superficial foot.

One ash case for room 10, second story, 12 by 20 feet 6 inches, less 16 feet square left out in center, made by T. J. Suter, cost $1,000, no pigeon-holes, at the rate of $5 per superficial foot. Contract awarded by Mr. Oertly.

One mahogany case for Fourth Auditor's Office, paymaster's division, with large pigeon-holes, 20 feet 6 inches by 13 feet, cost $1,104, at the rate of $4 10 per superficial foot. Made in Treasury extension shops.

One mahogany double case for Fourth Auditor, each 20 feet 6 inches by 13 feet, cost $2,049 28, at the rate of $3 84 per superficial foot. Made in the Treasury extension shops.

In conclusion, I have to state that all the furniture made in the shops of the Treasury extension is in excellent condition, and needs almost no repairs, while that made outside of the Department was and is in constant need of repair.

I am, very respectfully,

W. G. STEINMETZ,
Assistant Superintendent and Sworn Measurer.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department.

From a personal examination made by the committee of the furniture above referred to, the committee believe the above statement to give a correct idea of the relative value of the two classes of furniture.

With regard to the work done at the photographic establishment under the charge of the Supervising Architect, and its extent, value, and cost, the committee cannot do better than to submit the following letter of the Supervising Architect with respect thereto:

TREASURY DEPARTMENT,
Office of Supervising Architect, June 4, 1870.

SIR: I have to acknowledge the receipt of your letter of the 28th ultimo, and to say, in reply, that I have been unable to furnish the information desired by you, in consequence of my absence in the South.

With regard to your inquiries, I have to say that the expenses of the photographic establishment are not chargeable to any of the public works, the office being duly authorized by law as a portion of the office of the Secretary of the Treasury, the general supervision of it being vested in this office. As a consequence, the expenses for stationery, paper, &c., are payable out of the appropriation for the contingent expenses of the Secretary's office, and, therefore, no specific account has been kept of the number of drawings for the different buildings, an aggregate list only of the drawings being kept, except where the work is done for other Departments or Bureaus.

The expenses of the office per annum are as follows, viz:

Salary of photographer	$2,500 00
Salary of assistant photographer	1,374 43
Salary of second assistant photographer	832 00
Albumen and all other paper	304 35
Granulated silver	278 93
Gold	128 05
Chemicals, &c	69 30
Muslin	56 10
Total	5,543 16

The following is the number of photographs that have been prepared, viz:

Of architectural and miscellaneous drawings	15,459
Of counterfeit notes for Treasurer United States	572
Of drawings for architect United States Capitol	182
Of drawings for Light-house Board	121
Of drawings for revenue marine	119
Of maps of postal routes for Post Office Department	135

There have also been prepared 900 negatives, which form a part of the stock of the office, that will enable us to reproduce any drawing, that has been prepared at any time, at a nominal expense. These negatives alone are worth to-day to the Government more than the entire expense of the photographic office. By them the Department can reproduce for a few cents drawings that would cost from five to fifty dollars to reproduce in any other manner, except by lithography, which has been found by experiment to be more tedious, more costly, less accurate, and in every way inferior for our purposes to the present system. As regards the cost of the work, its cheapness is so well understood that the Department is compelled to decline, almost daily, applications from private parties to do work for them, the cost to be paid into the Treasury.

I may also add that during the war all the military maps were photographed in this office. This, you will readily perceive, was one of the most confidential positions that existed at that time, as the maps were of so secret a nature that even cabinet ministers were not allowed access to them, except by permission of the War Department.

It would be absolutely impossible to transact the business of the office with any degree of promptness, regularity, or economy without this establishment; and I may also add that it is in almost daily use in photographing original papers, vouchers, bonds, notes, and other documents for use in the United States courts in important suits, as well as for the use of the secret service division.

I regret that the information cannot be given you in a more accurate form, but to do so would involve the services of an additional clerk, the business done being sufficient to employ the entire time of one man to keep such a record as your committee desires. The advantages to be derived from this would not, in my opinion, justify such an expenditure; but should your committee deem it advisable, I should be very glad to avail myself of such an appointment.

In addition to the duties I have already specified, the large working drawings of the office, and maps for the use of the Department, are all backed with linen in that establishment, which alone occupies the greater part of the labor of one man.

Trusting this information will prove sufficient for your purpose, I remain,

Very respectfully,

A. B. MULLETT, *Supervising Architect.*

Hon. JOHN C. CHURCHILL,
Chairman Committee on Expenditures
on Public Buildings, House of Representatives.

The attention of the committee was also called to certain patent-rights owned at one time by the Supervising Architect, and sold by him to parties who, it was alleged, afterward sold the right to use these patents to the Treasury Department at an exorbitant price, in which price, it was further alleged, the Supervising Architect had a secret interest. The first of these was an improvement in locks patented by the Supervising Architect, and by which the key could not be withdrawn from the lock without locking it. This was sold to the Johnson Rotary Lock Company for $1,000. It appears from the evidence that the improvement was a substantial one, and that this company had sold locks largely to the Treasury Department before as well as after the sale of this patent to them, and not more largely after than before; and the committee think the evidence shows nothing improper in the transaction, except that such a sale by an officer of the Government having control of large purchases for its use, to a firm where he was accustomed to make such purchases, would readily furnish occasion of suspicion of unworthy motives on his part.

Another somewhat similar case was the sale by the Supervising Architect to A. R. Shepherd of a half interest in two patents, one for a patent roofing, and the other for a patent anti-freezing pipe. These patents had been procured by E. P. Vaux, whose claims had been at first rejected

by the Patent Office, on the ground that they covered nothing novel; but afterward, with some advice and assistance from the Supervising Architect, patents were obtained, and a half interest conveyed to him in compensation for such assistance. This half interest was conveyed to A. R. Shepherd, in April, 1869, for $6,000, and about three months afterward a contract was entered into with the owners of the patent, including Shepherd, by which they were to do such work in roofing and plumbing as the Government might assign them, and apply these patents to such work, and to receive in addition to the net actual cost of labor and material fifteen per cent., and, in addition, ten cents for each lineal foot of piping and for each square foot of roofing. The amount realized by the owners of these patents, for royalty, under this contract, in less than one year, was $5,615 65, as appears from the following statement:

Marine hospital, Portland, Maine, royalty on roofing	$915 80
Court-house and post office, Portland, Maine, royalty on roofing	245 50
Same building, royalty on pipe	64 00
Custom-house, Portland, Maine, royalty on roofing	181 10
Same building, royalty on pipe	93 60
Custom-house, Portsmouth, New Hampshire, royalty on roofing	675 00
Custom-house and post office, New Haven, Connecticut, royalty on roofing	672 60
Same building, royalty on pipe	28 80
Custom-house and post office, Richmond, Virginia, royalty on roofing	865 00
Same building, royalty on pipe	112 20
Court-house, Madison, Wisconsin, royalty on roofing	722 30
Custom-house, Cairo, Illinois, royalty on roofing	270 95
Court-house and post office, Des Moines, Iowa, royalty on roofing	758 80
Total	5,615 65

This seems to have been an excessive price to pay for the use of patents of such questionable validity, as the evidence shows them to have been; and the making of such a contract almost immediately after the sale to Shepherd is calculated to excite suspicion that that was intended to be done when the sale was made. The parties all deny any such intention, and the committee know how unsafe is the rule—*post hoc ergo propter hoc;* but they believe it would be wise for the Government to cancel this contract, and to adopt as a rule that the use of no patent should be paid for by any officer of the Government to whom the same or any interest therein had belonged during his official term. Soon after the examination of Mr. Shepherd by the committee, this contract was modified by the order of the Secretary of the Treasury so as to reduce the royalty for use of the patents one-half, or to five cents per foot; and also to make the fifteen per cent. addition applicable only to actual cost of labor and of materials, and not to include railroad fare and expenses of workmen, as had before been done.

The committee in making their investigations have been impressed with the absence of any legal provisions regulating the action of the Treasury Department, or of the Supervising Architect, in the erection and repair of public buildings, and as the expenditures for these purposes amount to millions annually, and are not likely to be lessened for many years to come, it is a matter of very great importance. The method of doing the work on these buildings by the day makes it the interest of all parties, superintendents, foremen, and laborers, to protract as long as possible the work; and this work is being done at such remote points that it is impossible for an officer in Washington, however vigilant and faithful, to correct or control this tendency. They also believe that in most places of sufficient population to require the erection of Govern-

ment buildings, intelligent and responsible contractors can be found who would carry out the plans of the Government, and at a cost much less than the Government could do for itself. It is further necessary, if economy is to be studied in the erecting of these buildings, that their cost should be within the control of Congress, and that the limits placed by it upon expenditures for these purposes should be strictly observed. To aid in accomplishing these objects, the committee have prepared the accompanying bill, which they submit to the House, and recommend its passage:

AN ACT to establish a Board of Commissioners of Public Buildings, and to limit the cost of buildings erected for the use of the Treasury, Interior, and Post Office Departments.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Secretary of the Treasury, the Postmaster General, and the Attorney General, shall constitute and be a board, to be called the Commissioners of Public Buildings, and as such shall have under their charge the erection, care, maintenance, and repair of all buildings erected or to be erected for the use of their respective Departments, or of either of them, and of all buildings heretofore under the charge of the construction branch of the Treasury Department, and the Supervising Architect of the Treasury shall be the secretary of the said board, and shall conduct its correspondence and superintend its business, subject to the orders of said board and to such regulations, not inconsistent with law, as the said board shall from time to time establish. The officers, clerks, and messengers of the construction branch of the Treasury Department shall be the officers, clerks, and messengers of the said board, and, with the Supervising Architect, shall be appointed by the said board.

SEC. 2. *And be it further enacted*, That it shall be the duty of the said board to report annually to Congress (which report shall form a part of the annual report of the Secretary of the Treasury) the transactions of the said board for the previous fiscal year, the condition of the public buildings under its charge, and the expenditures thereon, and, when the same are in process of erection, estimates of the sums necessary to complete the same, and also of the sums necessary or proper to be expended on each during the next fiscal year, with a statement of the original estimates of the cost of the said works, and of the sums expended thereon to the date of said report; and also to report from time to time, when requested so to do by either House of Congress, carefully prepared estimates of the probable cost of buildings proposed to be erected for the use of the Departments hereinbefore mentioned, or either of them, with a statement of the population of the cities or towns in which such erection is proposed to be made; whether suitable buildings can be rented for the accommodation of the business of the said Departments, and if so, at what cost; and whether, in the judgment of the said board, the public interest requires the erection by the United States of the proposed buildings.

SEC. 3. *And be it further enacted*, That no appropriation shall be made for the commencement of the erection of any building for the use of the Departments hereinbefore mentioned, or either of them, until a report has been received from said board as to the necessity of such erection and the reasons therefor, if such necessity exists, and the several matters with respect thereto referred to in the last preceding section, including carefully prepared plans of such buildings as in the judgment of said board the public interest may require, with estimates of their probable

cost; and such appropriation shall limit by its terms the amount to be expended in the erection of said building.

SEC. 4. *And be it further enacted*, That no part of any appropriation for the commencement of the erection of any such building (except for the purchase of a site therefor) shall be expended until full plans for such building have been prepared and submitted to and approved and adopted by said board, with carefully prepared estimates of the cost of the same, and no plans for such building shall be adopted by said board, the estimates of the cost of which shall exceed the amount limited by the terms of said appropriation for the cost of said building.

SEC. 5. *And be it further enacted*, That before any part of any appropriation for the commencement of any such building shall be expended, (except for the purchase of a site as aforesaid,) the said Supervising Architect, under regulations to be adopted by said board, shall advertise for proposals for the erection of said building, according to the plans adopted by said board, which advertisement shall invite proposals for the completion of said building according to said plans, including the furnishing the materials therefor; and also separate proposals for furnishing the materials and labor necessary in the erection of said building or any part thereof by classes; and the lowest bid for the erection of such building, or separate bids which, taken together, shall be the lowest bid for such erection, if made in accordance with the regulations of the board, and accompanied by proper security, and not exceeding the sum limited in the appropriation for the cost of said building, shall be accepted, unless the said board, for cause shown, shall specially order otherwise. The board may reject any proposal received by them for the erection of such buildings, and may advertise for new proposals, but in no case shall the lowest bid for such work and materials be rejected except with the assent and approval of the board, and no proposals shall be accepted which shall exceed the sum limited as aforesaid for the cost of such building.

SEC. 6. *And be it further enacted*, That this act shall apply to buildings now in process of erection, except as to contracts heretofore made and now in force. Whenever it shall become necessary to repair any building heretofore or hereafter erected for the use of said Departments, or either of them, the estimated cost of which repairs shall exceed one thousand dollars, it shall be the duty of the Supervising Architect to advertise for proposals for making such repairs; and the lowest bid received therefor, made in accordance with the regulations of the board, shall be accepted, unless the said board, for cause shown, shall specially order otherwise; and such order and the reasons therefor shall be stated in their annual report.

SEC. 7. *And be it further enacted*, That the said board may adopt regulations not inconsistent with law to govern the action of the Supervising Architect in advertising for proposals and in erecting and repairing the buildings under their charge, and the annual report of said board shall contain an abstract of all bids received by them for the erection or repair of the buildings under their charge, and shall designate what bid, if any, in each case, has been accepted; and when the bid so accepted shall not be the lowest bid offered, the reasons for rejecting such lower bid or bids.

TESTIMONY.

WASHINGTON, *April* 11, 1870.

A. B. MULLETT sworn and examined.

By the CHAIRMAN:

Question. What is your position?—Answer. Supervising Architect of the Treasury.

Q. How long have you occupied that position?—A. About three years.

Q. You had been employed in the office of the former Supervising Architect before being yourself appointed to that position, I understand?—A. Yes, sir; I had been assistant for some time.

Q. For how long?—Two or three years, I think—perhaps it may have been more.

Q. Mr. Mullett, will you please state to the committee, as concisely as you can, the history of the St. Paul, Minnesota, custom-house, and your dealings in connection therewith?—A. The appropriation for the St. Paul custom-house was made before the close of the war—how long before, I forget; it can readily be found by referring to the proceedings of Congress. After the war closed the question was called up in the Department, and by the Minnesota delegation in Congress, urging that the work be commenced. The Secretary decided that I should go and make an examination. But, first, Mr. Knox, of our Department, was sent out by Mr. McCulloch, as special agent, to select a site. This was in the fall of 1867. He selected a site, which was purchased; and then I was to go out to make a preliminary examination. But circumstances arose which rendered it impossible for me to go, and so Mr. Oertly went out and made that report to me. Mr. Oertly had written instructions from the Secretary.

Q. Let me understand: What was the first connection of your office with this building?—A. The sending out of Mr. Oertly to make the preliminary examination.

Q. Did you have anything to do with sending out Mr. Knox?—A. Mr. Knox was sent out by the Secretary of the Treasury.

Q. Then your connection with the matter commenced with the sending out of Mr. Oertly?—Yes, sir. I do not know who suggested the sending out of Mr. Knox. He had lived there some years. He was at that time a clerk in the Secretary's office; the Secretary had full confidence in him, and thought he was a good man to go, as he was a man of good practical and business talents, well informed as to the value of property, &c.

Mr. Oertley's report was here introduced in evidence, as follows:

"ST. PAUL, MINNESOTA, *September* 7, 1867.

"SIR: In accordance with your instructions of the 27th ultimo, directing me to proceed to St. Paul, Minnesota, and, if (after due examination of the ground and local building facilities) in my opinion advisable, to initiate the commencement of the work on the St. Paul custom-house, and to report, I have the honor to submit herewith the following:

"The site of the building to be erected is admirably chosen; it is on commanding and high ground, almost exactly level, and central both as regards topography and business. Perhaps it had been overlooked at the time of purchase, that the solid ledge of the St. Paul limestone underlies the surface of the lot, at an average depth of not more than 20 inches below said surface. This ledge of rock has a very even thickness, (it extends in exactly parallel sheets up to Minneapolis,) of about 9 feet, and extends under the whole of the lot.

"Though your instructions were to commence operations only in the case that (in my opinion) it would be possible to erect the cellar-walls this fall, I considered the work of excavation of such paramount importance, as to make use of the discretionary powers conferred on me, though it will not be possible to lay a single cellar-wall stone before next spring. I accordingly consulted with the Hon. Senator Ramsey, (who was also anxious for an immediate commencement of the work,) and the various gentlemen to whom you had directed me, as to the selection of a proper superintendent, and saw and conversed with the three principal applicants personally. After due consideration of their present business connections, and an inspection of their works, I selected Augustus F. Knight, esq., as the one who would suit the Department the best. I have the satisfaction to state that my selection met the views of the honorable senator, and those of your friends, as the inclosed letter of Mr. Wheelock addressed to you, but handed to me for opening, will prove. I had made the selection, entirely unbiased, before the letter was handed to me.

"The excavation will prove to be our quarry, except for trimming stones; it will furnish

all the cellar-wall stones, the ashlar of the outside walls, the backing of ditto, and the top courses which split to the sizes of bricks will furnish all our arching, and prove by far the superior material to the miserable bricks which can be obtained. The stones need but being got out by an experienced quarryman, and properly selected and assorted, and the bulk of the material for the whole structure will be obtained from the excavation without any extra cost of labor; the disposal of the surplus rock, for which a ready sale can be had, will go far to defray the expenses of the rock excavation. I located the floor of the entrance story 3 feet above curb at intersection of streets; assuming the cellar floor 10 feet below the entrance floor, or 7 feet below curb, we will have an average depth of 5 feet of rock excavation, and will have left the most solid stratum of rock, 4 feet thick, for an unsurpassed foundation. I would not advise to go any deeper than the above. There is immediately under the rock a stratum of clay about 3 feet thick, and under this that enormous bed of the St. Paul, white sand-rock, perhaps 75 feet deep. By the course I propose, all artificial foundations will be dispensed with, more than enough of building materials will be obtained, and the cost of the rock excavation, which increases with the depth, will be a minimum.

"Upon consultation with the honorable Senator and the various public officers, I found that the rooms afforded by the Madison plans would not suffice the service at St. Paul. There are rooms to be provided for the surveyor general and his office, and for the deputy collector of customs, in addition to all the office rooms furnished by the Madison plan. In consideration of this I directed Mr. Knight, as soon as he should receive your orders, to excavate the cellar story 130 feet long; should it ultimately be decided to have no larger building than that at Madison, this additional excavation will serve for coal vaults or areas. But I should regret if the dimensions of the building should not be increased; there is at present a vast difference in the amount of business transactions between Madison and St. Paul, those of the latter place being quadruple those of the former, with all the appearances (at St. Paul) of still more vigorous and immediate growth. I also directed the excavation to be made 75 feet wide, which will give an area of 8 and 10 feet wide on the yard side of the building. No materials (except lumber for sheds) being needed for a long time to come, I left no forms of advertisements nor any directions for such with the superintendent, and herewith inclose a copy of my instructions to him.

"The only stone work which will have to be purchased is that of the trimmings and cornice, and bets, and these stones ought to be selected with the utmost care from the various quarries early in spring, so as to give the quarried stone a chance to dry during the coming summer. Beautiful as the color and the appearance of the St. Paul limestone is, it is a very perishable material, and all trimmings and dressings ought to be avoided or reduced to a minimum. The seams open sometimes after the first winter exposure, and whole slices of moldings, base courses, &c., fall off. Complete wrecks of stones can be seen in buildings but a few years old. The only proper finish is the rough Russica, or rough ashlar, (random or coursed,) with trimmings shielded as much as possible. Whatever may spawl off the rough ashlar it does not injure the character or the looks of the work, and some of the churches erected in this manner by Mr. Knight look truly beautiful. For whatever trimmings may be introduced into the design, I would advise to arrange them all for the 7-inch stratum of stone, as this one is the freest of seams, and the most uniform. We will be sorely in need of good stones for the water-table: and hearing accidentally that a bed of granite had been discovered by the Pacific Railroad Company on their line of road, some thirty miles above St. Paul, I asked Mr. Knight to procure a sample of the same and transmit it to you.

"Should the granite prove worthy of quarrying, it would be a magnificent acquisition to western building materials, and just the thing for our sub-base, steps, coping and curbing, (perhaps even string-courses and trimmings,) because for all of the above uses the St. Paul stone is utterly unfit.

"There will be no difficulty in draining the building; it is but necessary to sink a small shaft through the rock, down to the sand rock, and in this latter the St. Paul pioneers burrow with the facility of moles, in any direction and to any depth, and it is not even necessary to line these sand tunnels; at least none of those in operation for several years have been lined and appear to be in perfect order yet. We will be able to effect the drainage of the building at a cost not exceeding $500. As there are no water-works in St. Paul, and none in prospect, a large cistern will become necessary. This, of whatever capacity may be decided upon, say from 10,000 to 15,000 gallons, will be treated somewhat like the sewers; it must be located underneath the limestone stratum and into the sand. A manhole through the rock will be required for getting the sand out and the lining materials in, the stratum of lime rock will form the cover of the cistern, and nothing will be required but the excavation of the sand and the lining, all of which can and ought to be done during winter. Some of the beer-cellars they have in the above sand rock, cut out with the utmost of care by common laborers and without any lining or vaulting at all, are really wonderful in this wonderful country.

"Taking everything into consideration, viz., the extensive rock excavation, the drainage, construction of the cistern, assorting, selection and partial dressing of the material, all of which can and ought to be done this fall and during the coming winter, and which if not

done now will throw all operations for the superstructure into the latter part of the season 1868, I hope you will approve of my action.

"Very respectfully,

"B. OERTLY.
"*Assistant Supervising Architect.*

"A. B. MULLETT, Esq.,
"*Supervising Architect, Treasury Department, Washington, D. C.*

"P. S.—I herewith return tin box with drawings, (for which I have no further use,) with a few small specimens of the saud rock underlying the limestone. The deeds for the lot never having been returned to St. Paul for recording, the Senator would thank you for immediate attention to the matter.

"Hope to be in Madison Monday 9th, and in Springfield 11th, but depend in a measure on good luck on the Mississippi, as every boat gets stuck in the mud, on account of low water, and gets detained beyond calculation."

Mr. Oertly's directions were simply to go and look over the ground and report with reference to the locality, material, &c. That is the first step taken in all such cases, where important buildings are contemplated; unless we have information sufficiently full and definite to render it unnecessary, which is very rarely the case. On the basis of Mr. Oertly's report I decided generally with reference to the material.

Q. Did you have any correspondence with Mr. Oertly while he was at St. Paul?—A. Not that I recollect; that report shows all that transpired, I believe. There are, however, some statements therein which were not verified in the result. For instance, Mr. Oertly says that the excavation for the foundation of the building will furnish all the stone needed for the building, except the trimmings. That is not the case. Only a portion of the stone is at all suitable for building purposes. The most of it is very inferior—fit only for cellar walls, or some similar use. His suggestion of the use of that stone for arching proved utterly impracticable.

Q. What was the next step taken with reference to the matter?—A. Well, we went on and prepared plans which were approved of in the usual course of business; and having finished excavating, went to work by the day, laying up the cellar walls.

Q. Had you not provided a superintending architect?—A. Yes, sir; I appointed a gentleman by the name of Augustus F. Knight, who had been recommended to me by Mr. Oertly, by telegraph. Knight received his appointment before Mr. Oertly left St. Paul, and has remained superintendent until the present time.

Q. Was Mr. Knight appointed on Mr. Oertly's recommendation alone?—A. No, sir; he was recommended also by Senator Ramsey, and by a gentleman connected with one of the St. Paul papers, named Wheelock. Mr. Knight was an entire stranger to me.

I wrote immediately to Mr. Knight, as follows:

"TREASURY DEPARTMENT, *September* 7, 1867.

"SIR: Inclosed please find your appointment as superintendent of construction of the proposed new court-house and post office building at St. Paul, Minnesota. You will perceive your compensation will date from the receipt of orders to commence work, which, if you have received any instructions from B. Oertly, esq., assistant supervising architect, you will consider are hereby given, and his instructions approved. In this case you will commence operations without delay. If, on the contrary, no instructions were given you by him, you will please inform me by telegraph, when instructions will be forwarded immediately on Mr. Oertly's return.

"Very respectfully,

"A. B. MULLETT,
"*Supervising Architect.*

"AUGUSTUS F. KNIGHT, Esq.,
"*Superintendent Custom-house, &c., St. Paul, Minnesota.*"

Mr. Knight entered upon the duties of his office immediately. As I have mentioned, the excavation for the cellar was made and the cellar walls laid up by the day. We at first supposed, in accordance with Mr. Oertly's report, that the excavation would furnish sufficient lime rock for the building; but Mr. Knight advised us that it would not. We did use a portion of that rock—used all we could; but only about two layers—say, one-sixth or one-eighth of the whole—proved valuable; the rest was worthless, except for "backing" and "filling." It became considerable of a problem what to do for stone for "dressing." We had at one time under consideration the propriety of using Cincinnati freestone—taking it down the Ohio River and up the Mississippi. About this time, I received a letter from a gentleman I used to know in Cincinnati, by the name of Chamberlain, in reference to Minnesota granite. The letter is as follows:

"ST. PAUL, MINNESOTA, *November* 9, 1867.

"FRIEND MULLETT: I came out here last July for the benefit of my health, and expect to reside here for some time. Some of my friends have lately gone into the quarrying business

and organized a company for that purpose, which is perfectly reliable in anything they undertake. They have secured a granite quarry, and forwarded specimens of the stone to your assistant, who located the site for the custom-house in this city. I would like your opinion in regard to the value and suitability of this Minnesota granite for building purposes.

"Yours truly;

"M. B. CHAMBERLAIN.

"A. B. MULLETT, Esq.,
"*Supervising Architect Treasury Department, United States.*"

Q. What further correspondence took place between yourself and the writer of this letter? A. That is all I ever got from him on the subject; he left St. Paul soon after; I never heard anything more from him upon the subject; since then he has died, without having any interest in the matter at all.

Q. Did you answer his letter? A. Yes, sir; I have my answer here.

"TREASURY DEPARTMENT, *November* 16, 1867.

'DEAR SIR: I have to acknowledge the receipt of yours of the 9th instant, and to say in reply, that while the Minnesota granite you refer to would not be considered a first-class stone here, yet, as compared with other samples from your locality, I deem it a valuable acquisition to the building material of the northwest.

"I trust we shall be able to use it for the dressings of the new custom-house in your city. This will depend altogether, however, upon the price at which it can be furnished, and I would suggest that it would be advantageous to the company to put it in at a low figure as an inducement for us to use it. We shall in that case have it cut by first-class workmen, and its fine appearance in a building so widely known as the custom-house will be cannot but aid materially in making the stone popular.

"Very truly yours,

"A. B. MULLETT,
"*Supervising Architect.*

"W. B. CHAMBERLAIN, Esq.,
"*St. Paul, Minnesota.*'

On the 13th of December, Mr. Knight replied to my letter to him, as follows:

"ST. PAUL, MINNESOTA, *December* 13, 1867.

"SIR: Yours of the 5th instant is just received. In answer, I have to say the report for the month of November was duly forwarded on the 6th instant.

"In regard to the cost of granite, from the best of information I can get, after careful inquiry, I estimate the cost, delivered in St. Paul at building site, as follows:

Dimension granite at quarry, estimated at	50 cents per foot.
Transportation by rail, 70 miles	15 cents per foot.
Transportation from depot to building	3 cents per foot.
Total cost per cubic foot	68 cents.

"Very respectfully,

"A. F. KNIGHT,
"*Superintendent United States Custom-house.*

"A. B. MULLETT,
"*Supervising Architect, Washington, D. C.*"

To this letter I replied as follows:

"TREASURY DEPARTMENT, *December* 9, 1867.

"SIR: Yours of the 1st instant is received. In reply, I have to say that it is absolutely necessary that you should obtain an offer from the owners of the granite quarries of the price at which they will agree to furnish the granite for the custom-house under your charge, or I must make other arrangements. I cannot wait while the owners of the quarries experiment on the cost of quarrying and delivering material. I certainly should like to use the material if it can be obtained at a fair price, but I must have an early decision.

"You will please close up work and dismiss all your employés, including the clerk, until the resumption of work in the spring.

"Very respectfully,

"A. B. MULLETT,
"*Supervising Architect.*

"A. F. KNIGHT, Esq.,
"*Superintendent Custom-house, St. Paul, Minnesota.*"

By MR. ELA:

Q. Is that letter in answer to the one from Mr. Knight, read just before, giving an esti mate of the probable price of granite?—A. Yes, sir.

Q. But I see it commences by saying, "Yours of the 1st instant," while Mr. Knight's letter to you is dated December 13th.—A. Well, when I wrote this letter I must have forgotten the date of Mr. Knight's. This is in answer to that, anyway.

Q. But you say to Knight that you "cannot wait while the owners of quarries experiment on the cost of quarrying and delivering material." Now, what had Knight said that called out that expression from you? I do not see anything on that point in his letter of the 13th of December.—A. That, I suppose, refers back to Oertly's letter to me. He says the Pacific Railroad Company had discovered granite on their line of road; and "should it prove worthy of quarrying, it would be a magnificent acquisition to western building materials, and just the thing for our sub-base, steps, coping," &c.

Q. But I do not understand why Knight, in writing to you, should refer to a passage in Oertly's letter to you?—A. O, I suppose these matters had all been talked over between them, while Oertly was up there.

Q. Was there any effort made to get bids from different parties?—A. Yes, sir; Mr. Knight was directed to investigate the whole subject, and see everybody. To the best of my knowledge he complied with those directions.

Q. There are no names mentioned here that I can discover?—A. Well, you have not all the letters there; I did not copy all the letters; I can copy every letter I have got, if you want me to. One thing I want the committee to bear in mind, viz., that this was the first building in the State of Minnesota in which granite was used; the first Government building in which granite from Minnesota quarries was ever used. Again, I would remind the committee of another thing, viz., that we scarcely ever commence a building anywhere but parties try to push new material on us. The whole thing becomes a mere matter of routine with me, and at once passes from my mind.

On the 20th of December, Mr. Knight submitted the following propositions for furnishing granite. He writes:

"ST. PAUL, MINNESOTA, *December* 20, 1867.

"SIR: I have at last succeeded in getting two proposals for furnishing granite for the St. Paul custom-house, which I herewith inclose. Not knowing the dimensions or quantity required, I was unable to give the bidders the information necessary to enable them to make as close a bid as they otherwise might have done. These will, I trust, enable you to decide as to its adoption. Should you require more accurate bids, please send me the approximate sizes and quantity.

"Messrs. Morris and Delano are thoroughly competent and reliable men, and will fulfill any engagement which they may make. I will add in this connection that they are owners of different quarries.

"Very respectfully,

"A. F. KNIGHT,
"*Superintendent United States Custom-house.*

"A. B. MULLETT, Esq.,
"*Supervising Architect, Washington, D. C.*"

The following are the bids or propositions accompanying the above letter:

"ST. PAUL, *December* 19, 1867.

"SIR: Understanding that you may require some granite stone in the construction of the St. Paul custom-house, I have the honor to submit the following proposals for first-class material, delivered on the site of building, Washington street, St. Paul: For all stone—1 by 2, 1 by 3, 1 by 4, 2 by 2, of the lengths from 4 to 10 feet, at the rate, per cubic foot, 56 cents. I am now taking out stone from my quarry for the St. Cloud bridge.

"Respectfully, your obedient servant,

'CHAS. W. F. MORRIS.

"A. F. KNIGHT, Esq.,
"*Architect St. Paul Custom-house.*"

"ST. PAUL, *December* 20, 1867.

"SIR: In reply to your request for a bid to furnish granite for the St. Paul custom-house, I have to say that I will furnish dimension granite, delivered at the custom-house, for and at a price ranging from 35 to 100 cents per cubic foot, according to the size and shape of the blocks required. Without a bill of the sizes I cannot give you an exact figure; but from my knowledge of the work, I should think that about 65 cents per cubic foot would be the price for all required. Will give you the exact figure if you will furnish me an exact bill of the dimensions, and how they are to dress.

"Yours, respectfully,

"D. R. DELANO.

"A. F. KNIGHT, Esq."

Q. Was there never any more definite specification of the class of granite wanted, sizes, &c., than that?—A. Certainly, sir; in the winter we prepared these drawings, and sent them to Mr. Knight.

Q. Were any proposals ever received that have come before the public, except from these two men?—A. Knight was ordered to get all the proposals he could, and I presume he did so.

Q. Do you recollect receiving a letter from a man by the name of T. M. Newson, desiring that, if a new custom-house was to be built, he might have an opportunity to put in a bid?—A. I believe that was the next letter I received from Minnesota.

Q. Is this the letter?—A. Yes, sir.

The letter reads as follows:

"ST. PAUL, MINNESOTA,
"*February* 18, 1868.

"SIR: For four years I acted as commissary and quartermaster in the United States Army. Have a clean release from all my accounts, and my bondsmen have been released. Have been fifteen years in the country. So much for introduction.

"My purpose in writing you is to give you the information that I am the owner of 123 acres of solid granite, at a town called Watab, on the Upper Mississippi. This granite is pronounced to be very excellent, and is the only great upheaval in the Mississippi Valley. David Dale Owen in his official report says, (page 168:) 'Near the road, and about two miles from the Osakis (Sauk) Rapids, there rises out of the prairie a dome-shaped mass of syenitic granite, elevated 10 to 12 feet above the level of the plain. It is worthy of notice here as being the first rock found *in situ* on the land route from the Falls of St. Anthony to Crow Wing.' On page 166 he says: 'Seven to eight miles above Osakis (Sauk) Rapids is a high exposure of crystalline rocks. A ridge of hornblende and syenitic greenstone, with veins of granite, bearing north 70° to 80° east, rises on the east side of the Mississippi to the height of 30 to 40 feet, and a short distance further back even to the height of 60 to 70 feet.' Watab is four miles *above* Sauk or Osakis Rapids, and a mile or two below Little Rock, on the Upper Mississippi. It is here where the rock rises from 60 to 70 feet.

"If the custom-house of this city is to be built of granite, I desire an opportunity to put in a bid.

"Respectfully yours,

"T. M. NEWSON,
"*Formerly Brevet Major, Commissary Subsistence United States Army.*

"Hon. A. B. MULLETT,
"*Supervising Architect Treasury Department.*"

By Mr. ELA:

Q. Did Mr Newson have an opportunity to bid?—A. I suppose he had. I cannot answer in regard to these minor particulars; why, sir, if I endeavored to keep track of all such little matters, it would take twenty supervising architects to perform the business of the office.

Q. Did you answer Mr. Newson's letter of ——?—A. In the mean time I had found out that Newson could not deliver granite.

Q. How did you learn that fact?—A. Why, his quarry is eighteen miles from the railroad.

Q. Is that any reason why he should not have an opportunity offered him to make a bid?—A. Could a man haul granite eighteen miles to a railroad?

Q. Is not granite a movable article as well as brick? You have not yet answered this question. Why was not a public opportunity given for men to bid?—A. It was a small matter, of so little importance, I supposed, being needed only for the dressings of the buildings; and, having an opportunity to get it at lower prices than we were ever able to get it for anywhere else, that it was not deemed worth while to advertise.

Q. Mr. Morris offers to furnish stone for 56 cents; why did you instruct Mr. Knight to pay 65 cents?—A. You understand that the larger the block of granite the more it costs; for that building we needed a great number of large blocks; taking this in consideration, 65 cents for granite, such as we wanted, was actually lower in proportion than 56 cents for such as Morris offers. I considered it extremely low.

Q. Who has made a bid for furnishing the granite on the specifications you have sent out?

A. I don't know; I have told you I cannot carry all these things in my head. I gave Mr. Knight carte blanche to make contracts, not to exceed 65 cents.

Q. Why did you say 65 cents, when here was an offer to furnish it at 56 cents?—A. Because the 56-cent offer was for a size much below what we wanted for the building.

Q. Why, then, was not an opportunity given him to say at what price he would furnish such sized stone as you did want?—A. I don't know but an opportunity was given him. I left that whole matter with Mr. Knight. I tell you, gentlemen, I cannot carry the minute details of transactions connected with twenty buildings a year, that are being put up by the Government, in my head.

Q. What was the size of the stone you used in the building?—A. Well, now, gentlemen, how can I be expected to be able to tell the size of every stone in every building put up by the Government all over the United States? I don't know what sized stone was used. By looking at these drawings ——

Q. But how do you know that this offer was for a different size from what you used, if

you do not know what sizes you used?—A. He restricts the size of the stone to 2 feet square. You will find that this building requires much larger stone.

Q. How large?—A. I cannot tell exactly; but I know they must be a good deal larger.

Q. Were any instructions given by you to Mr. Knight, from December until the contract was closed?—A. None, excepting such as were given in writing.

Q. Then the letters containing those instructions are just what we want; of all the more consequence to us because they contain what your memory cannot carry?—A. I can tell you beforehand, sir, that that is the only letter that has the remotest bearing upon the subject.

Q. Is not the granite quarried out at first in large size, and afterward split up into smaller sizes?—A. That may be true, to some extent; but the cost of splitting is very small, while the cost of handling is very great. If you think I am wrong, you can call in experts; you ought to know something about the matter yourself; you live in the Granite State.

Q. How many of these stones are larger than those mentioned in Mr. Morris's proposition?—A. I cannot say; it was so trivial a matter that I did not burden my mind with it.

Q. What has been the cost of the stone-work, so far?—A. I suppose $10,000. It will not exceed twenty thousand for the whole building. I looked upon it as a contract for $8,000 or $10,000 worth of granite. I am perfectly willing to let you take that schedule of the granite and go to New York and ask parties there if they will furnish it at the prices for which it is being furnished. I knew I was getting it below market prices.

By the CHAIRMAN:

Q. I understand, then, that no advertisements were ever published inviting bids?—A. No, sir; I talked with the Secretary, and he thought it not worth while to invite bids. I thought then that we could do better without advertising, and I think so still.

By Mr. ELA:

Q. How much more expensive would the stone of the sizes you speak of, as being necessary in the building, be, than the sizes Mr. Morris proposed to furnish?—A. More than the difference between the two bids.

Q. How much more?—A. The usual rule is a cent a foot, beyond 20 cubic feet. It varies some according to the quality of the stone. In opening a new quarry like that, large sizes ought to be worth a good deal more. The fact is, as I said before, I gave the matter very little attention; the price was so much lower than we had expected to be able to obtain it for. Why, we were then paying 85 cents per foot in Portland, Maine, for Concord granite. I never supposed there was any dissatisfaction about the matter; never heard of any until a month or two ago, when this notice appeared in one of the papers.

Q. Has Mr. Newson never written you regarding the matter?—A. No, sir; the first intimation I ever had of it was his miserable, filthy, lying communication in the papers there.

Q. If Mr. Newson wrote you a letter, making an offer to furnish granite, and requesting an opportunity to put in a bid, and you replied telling him that he should have an opportunity, and you afterward gave him no opportunity, would not that be sufficient reason why he should not have any further communication with you?—A. I don't think it would; he could have written to the Secretary of the Treasury. I tell you I believe that man has been bribed to do this thing. I regard him as a tool in the hands of this infamous crew that are persecuting me. He is a low, miserable, filthy, lying wretch.

Q. But does he lie when he says you promised to give him an opportunity to bid, and then closed the bargain without giving him any opportunity?—A. I say I would have given him an opportunity, under ordinary circumstances. But I knew it was utterly impossible for him to furnish us granite as cheaply as it was offered us elsewhere.

Q. But the question is, what right had you to assume that he could not furnish you the granite?—A. I have told you the whole matter was turned over to the superintendent, as it is in twenty, thirty, hundreds of other cases.

Q. Is that the usual course, to leave it to the superintendent?—A. If we were in a country where there was any competition, where granite could be supplied by several different parties, we would advertise.

Q. Very well; and do not your letters show that you have three different offers for supplying granite?—A. One of them is from a man who says he has quarry land; but quarry land is not a quarry.

Q. Are there not among your papers three offers to supply granite?—A. No, sir; only two.

Q. Why did you write to Newson that he could have an opportunity to bid?—A. Well, I never knew but what he had had an opportunity to bid.

Q. Who told you there was only one quarry from which stone could be furnished?—A. I cannot tell you now; that is a matter that occurred two years ago.

Q. It seems that the information came to you in such an authoritative shape that you acted upon it?—A. Well, Rankin, my assistant, was up there three weeks, and he repeats that information to me now.

WASHINGTON, *April* 12, 1870.

A. F. KNIGHT sworn and examined.

By the CHAIRMAN:

Question. Where do you reside?—Answer. At St. Paul, Minnesota.

Q. By profession an architect?—A. Yes, sir.

Q. How long have you practiced the profession?—A. Since 1854; have been in business on my own account since 1857.

Q. What is your present position?—A. Superintendent of the St. Paul custom-house.

Q. When did you receive your appointment as such?—A. In the latter part of 1867, September 15th; the exact date I do not remember.

Q. What was your first service as superintendent?—A. It was to organize a force of workmen, to ascertain how the material could best be conveyed to the ground, to provide for the foundation of the building, &c.

Q. When did you commence work on the foundation?—A. I think in September, 1867.

Q. Was there any work done during that fall?—A. About two-thirds of the excavation was made.

Q. Of what material was the substance excavated?—A. About one foot was earth, loam, and about half a foot of loose shell rock, and underneath that lime rock.

Q. What was the depth of the entire excavation?—A. About 8 feet 4 or 6 inches.

Q. What use was made of the lime rock which was taken out of the excavation?—A. It was piled adjacent to the building, such of it as could be of any use; the rubbish was dumped in the street in close proximity. Just below the site of the custom-house there is a depression in the grade of the streets, and this waste material was placed there to raise the streets to grade.

Q. What proportion of the lime rock obtained by the excavation was subsequently used in the construction of the building?—A. Not much; there is considerable limestone there yet, which it was at first thought might be susceptible of being used in the building, but which cannot. I suppose about one half of the quantity at present on hand may be put to some use somewhere in the building. But very little of it has been used for face work. So far as we have used it it has been for backing, so called.

Q. Wnat proportion can be used for face work?—A. I should say about one-eighth: it is next to impossible to judge of that. I can only judge of it from the result so far as I have gone into one of the piles.

Q. What is the character of the rock at St. Paul and vicinity?—A. It is all lime rock.

Q. Is the quality fit for building purposes?—A. Yes, sir; not first-rate, but fair; will do for ordinary buildings.

Q. What is the character of the stone taken from this excavation?—A. Some of it is very good stone. There is a layer about two-thirds of the way down from the top which can be made useful in many parts of the building; some of the rest of it will do for common rubble stone. Some of it is of the kind that is used about St. Paul as a foundation for cheap wooden houses, for cellars, &c.

Q. You say that one-eighth of the stone taken from this excavation is of a kind fit for facings?—A. Yes, sir. For facings we need stones sometimes 10 to 12 inches thick; but in this cellar excavation there are none above 8 inches thick, and those not very sound. Some of it will do for some portions of the face work; we are using it for that purpose. It is as durable as the other stone we are getting, and more easily handled and worked, because it splits to nearly the proper thickness.

Q. What proportion of the stone excavated can you use in any way?—A. I do not think we have used one-fourth of the stone excavated so far.

Q. Are your arrangements such that all the stone from that excavation that is fit to be used will be used?—A. Yes, sir; but we will have to purchase more elsewhere for facings.

Q. When did you commence the laying of the foundation of the building?—A. In the spring of 1868.

Q. You have purchased then, I infer, a large part of the limestone which has been used in the construction of the building thus far?—A. I think I have purchased about 1,000 or 1,500 feet of limestone only.

Q. Did you purchase or lease a quarry?—A. I leased a quarry.

Q. How far from the building?—A. About six or seven blocks; equal to 2,400 or 2,500 feet, I should think.

Q. Of whom did you lease?—A. From William F. Davidson.

Q. By written lease?—A. No, sir, by a verbal lease.

Q. When was that lease made?—A. About the time the foundation was commenced; in the fall of 1867.

Q. Can you state the terms of the lease?—A. I was to pay 3 cents a cubic foot for the rock measured in the quarry, not counting the stripping; that is, I was to pay for the quarry solid, 3 cents a foot for the cubic contents of the place from which the stone was taken out.

Q. That is, you were to strip the quarry at your own expense, and be at your own expense in getting out the stone, and then to pay 3 cents a cubic foot for all the stone that you found suitable for the building?—A. Yes, sir.

Q. Not paying for the waste?—A. Yes, sir, paying for the waste.
Q. What did you do with the waste?—A. Some of it was piled up in a refuse pile near the building: some of it was dumped into the street.
Q. What was the object of hauling this refuse, when you had more refuse already than you could use?—A. It struck me that that pile was growing smaller, so I set teams to work and hauled this refuse down there.
Q. Was this price of three cents a cubic foot to apply to stone that you took off in stripping before you got down to layers of rock that you could use?—A. No, sir.
Q. Where was the measurement of rock to be made?—A. In the quarry. I would say that they have an established rule of measurement there which I adopted, and also their price.

By Mr. ELA:

Q. You said you did not pay for the poor rock that you stripped off from the good; who had the benefit of that?—A. Nobody; it was of no use to anybody. I had to dispose of it, to get it out of the way at the nearest point.
Q. All of it?—A. Yes, sir.
Q. Was not a portion of this, before you got down to the rock that was fit for use as facing, good for other purposes?—A. Yes, sir.
Q. What did you do with that?—A. Piled it up adjoining the quarry, and afterward hauled it to the refuse pile.
Q. How much of that surface was of that kind of stripping?—A. I should say perhaps 25 or 30 yards.
Q. For how many feet in depth?—A. Not a foot; some 6 or 7 or 8 inches.
Q. Then you came to good stone?—A. Yes, sir.
Q. There was not much stripping then?—A. There were about 20 inches of stripping of earth before coming to any stone at all.
Q. So the entire waste in stripping was 18 or 20 inches of earth and about 6 inches of stone?—A. Yes, sir.
Q. How deep in the ledge did the stone run which you could use for backing before coming to the stone which could be used for facing?—A. About 2½ feet.
Q. How thick was that portion of the ledge which was fit for use in the building for facings?—A. About 3 or 3½ feet.
Q. Why go below 3½ feet of first-rate stone?—A. Well, we had to take the quarry—the whole or none.
Q. What was the total depth to which you went?—A. Thirteen or fifteen feet.
Q. What was the size of this quarry—the superficial extent?—A. There are papers here that will tell. I should say something like 28 or 30 feet each way.
Q. And you were obliged to go to the bottom of the ledge?—A. I do not remember whether we were obliged to go to the bottom of the ledge or not.
Q. And these were the best terms you could get?—A. I thought so, sir.
Q. Could nobody else be found to compete when hundreds of acres of land were underlaid by limestone?—A. There were other quarries, but they were all leased; parties were working in them.
Q. Had this not been opened at all?—A. Oh, yes, it was well opened; others were working in other parts of the quarry.
Q. Then you only leased a portion of the quarry?—A. Yes, sir; but we were to have as much more in that corner as we required, but must take it out in the same manner.
Q. It was a lease of a quarry already opened and being worked?—A. Yes, sir, with the privilege of more.
Q. Well, were there not other quarries whose owners would have been glad to have competed?—A. I think not.
Q. Did you make any effort to find out?—A. I am familiar with the quarries and with the persons owning quarries, and am sure that no better terms could have been made.
Q. Did you make any effort to obtain bids from the owners or lessees of limestone quarries elsewhere?—A. No, sir.
Q. How long did you continue to work this quarry yourself?—A. Till all, or nearly all, the stone had been taken out.
Q. That is from that space of 28 by 30 feet?—A. Whatever it was; I did not intend to give the exact figures. The cold weather came on just before I got out the last of the ledge.
Q. Do I understand that you had exhausted the quarry substantially, so far as that 28 by 30 feet was concerned?—A. Yes, sir.
Q. Did not the stripping of that portion of the quarry render it easier and cheaper to work the adjacent portion of the quarry than if you had not worked this portion?—A. Perhaps it would make a little difference.
Q. Why did you not continue to obtain your stone in that way under that lease?—A. I think I found that I had all the backing necessary, and that to get any more from that quarry would be merely to accumulate more material of that kind on the ground than could be used in the building, and so concluded that thereafter I would purchase such rock only

as would be wanted, and on representing the facts was ordered to do so by the Supervising Architect.

Q. Did you make an agreement to purchase?—A. Yes, sir.

Q. From whom?—A. From William F. Davidson

Q. When was that contract made?—A. In the spring of 1869.

Q. In writing?—A. No, sir.

Q. Verbally?—A. Yes, sir.

Q. What were the terms of that contract?—A. To the best of my recollection, I pay 31 cents a cubic foot; I may be wrong in that figure, however. I can tell by reference to the papers.

Q. Have you not been paying for stone?—A. Yes, sir; but I always refer to those papers—at least whenever there is any doubt.

Q. What was the stone for which you paid that price—stone to be used for facing only?—A. Yes, sir; any other kind, if sent, was rejected.

Q. How much stone have you received under that verbal contract?—A. A thousand to twelve or thirteen hundred feet.

Q. Less than 1,500?—A. Yes, sir. I made arrangements at first for a thousand feet, but I found that was not enough and got some more.

Q. How was that contract; for only so much stone as you were pleased to order?—A. The contract was for a thousand feet, with the privilege of more.

Q. Was there anything in the contract as to dimensions?—A. No, sir; except that they were to be of large size, to be cut up to suit.

Q. Was any opportunity given to other parties to compete for the furnishing of this limestone after you concluded to give up the other quarry?—A. Yes, sir.

Q. What opportunity?—A. I examined another quarry in a different direction, just opening or partly opened; I asked the party opening it to bid if he wished, but he declined to do so. I afterward made another examination of the same quarry, before letting the work, and found that the stone would not do, because it was of a darker color; it would not match that already in the building. I do not know but that it was otherwise as good a stone as any.

Q. Was any advertisement published asking for proposals for limestone?—A. I do not recollect whether I advertised or not.

Q. This was only a year ago, was it not?—A. My recollection is not definite.

Q. Have you any recollection of advertising?—A. I have not.

Q. Did any party speak to you desiring an opportunity for bidding for limestone?—A. Yes, sir.

Q. Who?—A. A man by the name of O'Brien.

Q. When?—A. In the spring of 1869, I think.

Q. Before you made this arrangement for the thousand feet with Mr. Davidson?—A. I believe so.

Q. What proposals did Mr. O'Brien make?—A. He made none.

Q. You say he desired to make a proposal; did he have an opportunity?—A. Yes, sir.

Q. State what took place in regard to the matter.—A. I told him I had examined his quarry, and found that the color of the stone was unsuitable, (too dark,) and would not match with the stone already in the building.

Q. Oh, he was the owner of the quarry you spoke of a little while ago?—A. Yes, sir.

Q. Did any other person speak to you about proposals for limestone?—A. Not that I remember.

Q. What other material do you use for the walls of this building beside limestone?—A. Brick and granite.

Q. Where is the granite procured?—A. On the line of the St. Paul and Pacific Railroad, sixty-eight miles above St. Paul.

Q. What is the name of the place?—A. It is on the prairie—has no name that I know of.

Q. By whom is it furnished?—A. The man's name is F. R. Delano.

Q. Are there any other granite quarries in that vicinity?—A. There are other granite ledges, but none worked that I know of.

Q. Is this quarry owned by Mr. Delano or does he represent a company?—A. I believe he represents a company, though I do not know that as a fact.

Q. What is the name of the company?—A. The Minnesota Granite Company.

Q. Is that a corporate body under the laws of the State?—A. I do not know whether it is incorporated or not.

Q. Are there not other quarries in the State?—A. None that I know of.

Q. How extensive are these granite ledges?—A. There are numbers of them scattered over a considerable extent of country. This one covers, coming out here and there in different spots, 20 or 30 acres, perhaps more.

Q. When did you first begin to receive the granite for the building?—A. I think in June of 1868.

Q. Is that granite obtained for the building under a contract?—A. Yes, sir.

Q. Is this a copy of the contract?—A. Yes, sir.

"*Contract between the United States of America and F. R Delano.*

"This contract, made and entered into by and between A. F. Knight, superintendent of construction of the United States custom-house and post office in the city of St. Paul, State of Minnesota, for and in behalf of the United States of America, of the first part, and F. R. Delano, of the county of Ramsey, State of Minnesota, to whom was awarded contract for furnishing all the granite in rough for the said United States custom-house, in such quantities and of such dimensions as will hereafter be ordered by the superintendent, on his bid for the same, dated April 22, A. D. 1868, of the second part, witnesseth: That the party of the second part covenant and agree to and with the party of the first part, for himself, his heirs, executors, administrators and assigns, to furnish, deliver [ed(?)] at the site of said custom-house and post office, all the said granite, to the approval and acceptance of the superintendent of construction, in such quantities, at such times, and for such parts of the said building as the said superintendent shall require. And the said party of the first part, acting for and in behalf of the United States, doth covenant, promise, and agree to pay, or cause to be paid, unto the said part [y(?)] of the second part, his heirs, executors, administrators or assigns, 65 cents per cubic foot for all the granite delivered and accepted as aforesaid, good and lawful money of the United States; the payments to be made in the following manner, viz: Ninety per cent. (nine-tenths) of the value of the granite furnished and delivered as aforesaid will be paid from time to time as the same shall be furnished and delivered, the said value to be ascertained by the superintendent; and ten per cent. thereof (one-tenth) will be retained until the completion of the delivery and the approval and acceptance of the same by the superintendent, which amount shall be forfeited by said party of the second part in the event of the non-fulfillment of this contract to the entire satisfaction of said superintendent.

"It is further covenanted and agreed by and between the parties to this contract, that if, from any cause whatever, the said party of the second part should fail in required promptness in furnishing and delivering the said granite by or within the time or times specified above, it shall become the duty of the said superintendent, and he shall be, and hereby is, authorized and empowered, after eight days' due notice thereof, in writing, left at the shop, office, or usual place of abode of the said party of the second part, or with his agent, without effect, to purchase and supply any deficiency of the granite caused by the delinquency of the said party of the second part; and the actual cost thereof, together with 15 per cent. thereon, shall be deducted from any moneys due or owing to the said party of the second part on account of this contract; and if that account be not due him, then his bondsmen are to be held liable for any deficiency, to be recovered of them by suit in the name of the United States; or the said party of the first part may elect that if the party of the second part should fail to —— by or within the time or times specified above, that he shall forfeit the sum of —— per diem for each and every day thereafter until the final ——, which sum shall be deducted from any moneys which may be due ——; and if that amount be not due ——, then —— bondsmen are to be held liable for any deficiency, to be recovered of them by suit, in the name of the United States.

"It is further covenanted and agreed between the parties to this contract, that the party of the second part shall execute, with two or more good and sufficient sureties, a bond to the United States in the sum of —— conditioned for the faithful performance of this contract, and the agreements and covenants herein made by the said party of the second part.

"It is also covenanted and understood that no member of Congress, or other person whose name is not at this time disclosed, shall be admitted to any interest in this contract; and it is further covenanted and agreed that this contract shall not be assigned except by consent of the Secretary of the Treasury; and that any assignment thereof, except as aforesaid, will be a forfeiture of the same.

"It is also covenanted and agreed by and between the parties hereto, that if any of the granite shall be delivered on the site of the said United States custom-house and post office, by the party of the second part, and estimated, and a percentage paid thereon by the party of the first part, before they are put into the building being delivered to the superintendent, they shall become the property of the United States.

"It is further covenanted and agreed by and between the parties hereto, that this contract shall be valid and binding when approved by the Secretary of the Treasury, and not otherwise, and no departure from its conditions shall be made without his written consent.

"In witness whereof the parties hereto have hereunto subscribed their names and affixed their seals this 14th day of May, A. D. 1868.

"A. F. KNIGHT. [SEAL.]
"F. R. DELANO. [SEAL.]

"Witnesses to the signature of the superintendent:
"JAMES H. PLACE.
"CHARLES MARCOTTE.
"Witnesses to the signature of the contractor:
"JAMES H. PLACE.
"CHARLES MARCOTTE."

"BOND.

"Know all men by these presents, that we, ——— ———, of the city of St. Paul, county of Ramsey, and State of Minnesota, principal, and W. F. Davidson, of the city of St. Paul, county of Ramsey, and State of Minnesota, and H. L. Carver, of the city of St. Paul, county of Ramsey, and State of Minnesota, sureties, are held and firmly bound unto the United States of America in the sum of $10,000, to be paid in liquidated damages; for the payment of which, well and truly to be made to the United States, we bind ourselves, our heirs, executors, administrators, or assigns, jointly and severally, firmly by these presents.

"Sealed with our seals, and dated this 14th day of May, A. D. 1868.

"The condition of the above obligation is such that if the above-bound F. R. Delano shall well and truly perform all the covenants contained in a certain contract attached hereto, bearing date May 14, A. D. 1868, between A. F. Knight, superintendent of the construction of custom-house at St. Paul, Minnesota, for and in behalf of the United States, of the first part, and the said F. R. Delano of the second part, to furnish and deliver all the materials, and do and perform all the work required by said contract in constructing or completing the building authorized to be erected at St. Paul, Minnesota, then the above obligation to be void; otherwise to remain in full force and virtue.

"In testimony whereof the said F. R. Delano, W. F. Davidson, and H. L. Carver have hereunto subscribed their hands and affixed their seals the day first above written.

"F. R. DELANO. [STAMP.]
"WM. F. DAVIDSON. [STAMP.]
"H. L. CARVER. [STAMP.]

"Signed, sealed, and delivered in presence of—
"JAS. H. PLACE.
"CHARLES MARCOTTE."

[Revenue stamp, canceled.]

"STATE OF MINNESOTA, *County of Ramsey, City of St. Paul, ss:*

"Personally appeared before me, a notary public in and for said city of St. Paul, the said W. F. Davidson and H. L. Carver, who signed the above obligation, and who made solemn oath that they are each worth $5,000 over and above their legal liabilities.

"W. F. DAVIDSON.
"H. L. CARVER.

"Sworn to and subscribed, as above written, this 14th day of May, A. D. 1868.

"C. K. DAVIS,
"*Notary Public, residing at St. Paul, Minnesota.*"

"OFFICE OF THE UNITED STATES DISTRICT ATTORNEY,
"DISTRICT OF MINNESOTA,
"*St. Paul, Minnesota, May* 14, 1868.

"I hereby certify that W. F. Davidson and H. L. Carver, the sureties who have signed the foregoing bond, are known to me as residents of the city of St. Paul, State and county aforesaid, and citizens of the United States; and that I believe them to be amply sufficient security for the amount thereof, and that the bond is good.

"C. K. DAVIS,
"*United States District Attorney, District of Minnesota.*"

Q. What amount of granite have you received under that contract?—A. I cannot answer.

Q. Can you give an approximation?—A. Perhaps the amount of $9,000 or $10,000; perhaps more.

Q. And how much more would be required?—A. From $2,500 to $3,000 worth.

Q. The whole will amount to about $16,000, then?—A. I think a little less. My original estimate was between $15,000 and $16,000. That estimate was not exactly accurate, of course; we cannot make such estimates exact to a dollar. The figures of my estimate I find were $15,529 80.

Q. Before entering into this contract were any original advertisements published asking for proposals for the furnishing of granite?—A. Yes, sir.

Q. Inserted in what papers?—A. I think in the Press, of St. Paul, and also in the Pioneer.

Q. When were these advertisements published?—A. It must have been somewhere near the 1st of September, I think—perhaps not later than August.

Q. What year?—A. 1868. When I come to think, it must have been earlier—as early as as April, I am inclined to believe; the 1st of April.

Q. 1868?—A. Yes, sir.

Q. Are you sure that such advertisements were inserted?—A. Yes, sir.

Q. How many times were they inserted?—A. I think for ten days.

Q. In daily papers?—A. Yes, sir. Ten days, I believe, is the rule.

Q. Have you any copies of that advertisement with you?—A. No, sir; I have not.

Q. Can you state the contents of that advertisement in general terms?—A. I can give the substance; it ran about as follows: "Proposals will be received for the furnishing of granite for the St. Paul custom-house at the office of the superintendent on or before such a date," whatever the date was.

Q. Did you see the advertisements in the papers?—A. Yes, sir.

Q. Were they conspicuously inserted?—A. Yes, sir; as much as advertisements ordinarily are—I think a little more displayed than in ordinary advertisements.

Q. Do you recollect whether attention was called to them in the editorial columns of the papers?—A. I cannot say as to that.

Q. How many propositions were received under those advertisements?—A. I think two only.

Q. From whom?—A. One from Mr. Delano and one from Mr. Morris.

Q. Were those propositions in writing?—A. Yes, sir.

Q. What was the price at which Mr. Morris proposed to furnish the granite?—A. I think 55 cents. I will not be sure as to that; it might be more.

Q. What was the price at which Mr. Delano proposed to furnish it?—A. I do not recollect that.

Q. Was it the price mentioned in the contract?—A. I think not; I think it was more. I think his bid must have about 70, or in that vicinity.

Q. Are those proposals now in existence?—A. I think they are—in Mr. Mullett's office.

(Witness, on having his memory refreshed by Mr. Mussey, who was present as counsel for Mr. Mullett, upon reconsideration comes to the conclusion that advertisements were made at this .time, but that the advertisements of which he has been speaking referred to proposals made in December previous.)

Q. Were the proposals of Mr. Delano and Mr. Morris put in subsequently to the advertisements of which you spoke?—A. Yes, sir.

Q. And put in, as you understood, in answer to those advertisements?—A. Yes, sir.

Q. So that if you were mistaken as to the time when those proposals were submitted you wish to correct your statement as to the time when those advertisements were inserted?—A. Yes, sir. I think the first proposals were in some way informal. I believe they were received before any advertisements were put into the papers, but I am not sure.

Q. Then those proposals were not in answer to the advertisements?—A. I cannot say.

Q. What is their date?—A. I think some time in December. I think one of the proposals was dated the 24th of December; the other perhaps earlier.

Q. Who made those proposals?—A. One is from Mr. Morris and one from Mr. Delano.

Q. Mr. Knight, look at those papers and see if they are the propositions to which you refer?—A. Yes, sir, those are the same; I see that at the time these propositions were submitted we had not decided whether to use granite in the superstructure or not. I got these proposals merely to see what the probable cost would be.

Q. And are these two papers the bids to which you refer?—A. Yes, sir.

Q. And this letter, dated the 20th of December, commencing, "I have at last succeeded in getting two proposals for furnishing granite," is the letter which accompanied these bids to Washington?—A. Yes, sir.

Q. Were any other bids advertised for after the 20th of December?—A. I do not think there were.

Q. Then, when were those advertisements inserted?—A. I may have been mistaken as to those advertisements.

Q. In what respect?—A. As to their being inserted at all.

Q. What is your impression in regard to the matter?—A. My impression is now that I did not advertise at all. I made originally an estimate of the cost of the granite as well as I could; I estimated that it would cost about 68 cents a foot. Plans were sent to me, and a schedule of stone. I received a letter from Mr. Mullett directing me to get bids; we thought then we had not time to advertise and secure proposals, and I saw Mr. Delano and Mr. Morris. Mr. Morris had then abandoned his work. Mr. Mullett stated——

Q. When was that?—A. I do not know; it was after the date of this letter. Mr. Mullett stated that, if I could not get the contract cheaper, I should close one at a price not exceeding 65 cents per cubic foot; a large part of them were small stones, but some of them were very large.

Q. How large were the largest stones?—A. Some of them were to weigh perhaps six tons.

Q. What was their size?—A. Perhaps 10 feet long, and in the neighborhood of 6 feet wide and 15 or 16 inches thick.

Q. What were stones of that size to be used for?—A. Those I speak of were for cornices, some of them; others for window and door springers; others for columns.

Q. At the time you wrote this letter, December 20, you had not such instructions from Mr. Mullett as would enable you to give the dimensions of the stone you required?—A. No, sir; the plans at that time were not completed.

Q. When did you receive instructions which enabled you to give the dimensions of the stone you wanted, so that bids could be made therefrom?—A. Soon after the 20th.

Q. How came it that Mr. Morris made his offer for granite of a particular size; had you

had any conversation with him in which those sizes had been referred to?—A. No, sir; I think not.

Q. Why should he say, then, that he would furnish stone of such and such sizes at a given price?—A. I understand that he had been building a bridge pier partly of granite, and I suppose that those were the sizes he had been using in that bridge; and, not knowing what sizes were to be used in the custom-house, he made proposals for furnishing the same kind of stone which he had been using before.

Q. How many stones would you need in that custom-house larger than the largest size here proposed—about 10 feet long and 2 feet square?—A. Perhaps a hundred. There were a number of columns to weigh about six tons in the rough, some double springers, door and window arches, side columns for pilasters, &c.; these would weigh about three tons; they were to be only 8 feet long and about 2½ or 3 feet square in areal section. But you would get a much better idea by referring to the plans than I can give you by any description.

Q. Would it not be easier to quarry stones of that size than of a smaller size?—A. It is generally considered much more difficult.

Q. Do you not quarry the stones large and split them up?—A. Yes; but in breaking them they are apt to break up the wrong way.

Q. If a man had a contract for a large quantity of stone, would he make any difference in price for furnishing stone of the size you speak of?—A. I think he would.

Q. How much difference?—A. I cannot say.

Q. In your judgment, how much?—A. Twenty per cent. would probably cover it. I am not sufficiently familiar with quarrying to be able to give a valuable opinion on the subject.

Q. This estimate which you made of 68 cents a cubic foot as the probable cost of granite for this building, was it made before or after you received these bids?—A. I think some time before I received any bid.

Q. If you are not familiar with the prices of stone, how were you able to know that 68 cents would be a fair price?—A. From the best information I could get.

Q. From whom did you obtain that information?—A. From perhaps half a dozen parties.

Q. Where were they?—A. In St. Paul and elsewhere in Minnesota.

Q. Can you give the names of any of them?—A. I conversed on the subject with a man of the name of Brown; another was named Robinson. I know I conversed with others, but I do not recollect the names of the others. I know I took a good deal of pains to obtain as accurate information on these points as I could.

Q. Where did these men reside?—A. Brown lived in Stearns County, but has worked on the custom-house since then; Robinson was a quarryman in St. Anthony.

Q. Were they men who had had connection with stone work in the West?—A. No, sir; I understood that they had never touched any granite in the West. I also arrived at my conclusion as to price in part from taking the actual cost of granite in the East, comparing the price of labor in the East with the same in the West, and drew my own conclusions; taking also the difference in currency into consideration.

Q. What is the reason you did not advertise for bids for granite as well as for brick?—A. The season had so far advanced that I deemed it necessary to have the granite quarry opened as soon as possible.

Q. When was the idea first conceived of using granite in the construction of the building?—A. I knew nothing of it until some time in the winter of 1867.

Q. How early in the season can you commence opening a quarry in that country?—A. Some say the middle of March, some the 1st of April.

Q. Was there not ample time, from the time you first heard the suggestion until the time when a quarry could be opened, for you to advertise?—A. I find, on referring to my memoranda, that I received no instruction to use granite until the 9th of April. Mr. Mullett wrote to me asking me to make some estimate. I made some estimate myself, and I got these two estimates from Mr. Morris and Mr. Delano; whether I sent my estimate to Mr. Mullett before I received the others or not, I do not know.

Q. What material was intended to be used, if not granite?—A. We were to use limestone.

Q. Were there any steps taken to make a contract with anybody for limestone?—A. Not that I know of.

Q. Why not?—A. I cannot say, unless it was because it was not yet decided which to have. Granite is considered to be so much better that I supposed Mr. Mullett thought best to have it if it could be got at a fair figure.

Q. How were you to know what was a fair figure unless the matter was thrown open to public competition?—A. I could generally tell.

Q. Had you been in the granite work so as to know what was a fair price?—A. No, sir; and, so far as competition is concerned, I doubt whether any competition at anything like a fair figure could have been had. It was difficult to get hold of granite; it was difficult to get quarrymen; it was next to impossible to get cutters.

Q. What is a fair difference between the price of quarrying granite and the price of quarrying limestone?—A. I suppose it is worth about three times as much to quarry granite as limestone; at least a great deal more.

Q. You were not contemplating the construction of a building without using either limestone or granite, were you?—A. No, sir.

Q. Then why not issue proposals for them as well as brick?—A. The brick was not to come into use until a long time afterward.

Q. Which was to be used first, the brick or the limestone?—A. There was not much brick to be used in the basement.

Q. Was not limestone or granite to be used in the basement?—A. Yes, sir, in that portion that was above ground.

Q. Does it not take a great deal longer to prepare a kiln, and burn brick, and get it ready for use, than it does to open a quarry and get out limestone?—A. Yes, sir.

Q. Between September and spring was there not time enough to make a contract for limestone?—A. Yes, sir, plenty.

Q. Why not make one, then?—A. Because at that time I did not understand Mr. Mullett's instructions; I understood my instructions to be to do the work by days' work, therefore I opened that quarry. Finding that I could purchase limestone cheaper than I could get it out by days' work, I abandoned that first plan.

Q. How long did you work that quarry?—A. One season.

Q. How far below the surface did the basement of the custom-house building extend?—A. Eight feet.

Q. Did that take you through the limestone bed?—A. Not through.

Q. How much below that did it extend?—A. About 2½ feet.

Q. How did you know that if you did not go down any further?—A. Because men have gone down further in other places. I am perfectly familiar with the character of the rock there; there is an old well there which shows the nature of the stone completely.

Q Did you sell any of the limestone taken out during the excavation of that building?—A. No, sir.

Q What did you sell?—A. Nothing.

Q. Did you advertise nothing for sale in the St. Paul Press?—A. I think not.

Q. How then comes this bill for advertising in your account?—A. I think there must be some mistake.

Q. Did you never sell any stone?—A. No, sir.

Q. Nor offer any for sale?—A. No, sir.

By the CHAIRMAN:

Q. Was Mr. Delano one of the persons with whom you conversed when you endeavored to learn the cost of granite?—A. No, sir, unless as superintendent of the railway I inquired of him the cost of transportation.

Q. Is that your letter to Mr. Mullett communicating the cost of the granite?—A. Yes, sir.

Q. You stated a short time ago that you thought Mr. Delano's proposal for furnishing granite was at a higher price than 65 cents?—A. Yes, sir, I thought so.

Q. On examining the proposal you find that impression to be correct?—A. The proposal says from 35 to 100 cents; probably about 65 cents would be the average of the whole.

Q. The instructions under which you finally closed your contract with Mr. Delano are contained in this letter of April 9, 1868, from Mr. Mullett to you, are they not (handing witness the letter)?—A. That is the letter.

Q. Under which you entered into the contract with Mr. Delano?—A. Yes, sir.

Q. You have said here that Mr. Morris's offer would cover all the stone to be used in the building except a hundred—that a hundred stones would have been larger than he describes?—A. I did not intend to say exactly a hundred—it may be more, it may be less.

Q. Were any efforts made between the 20th of December and the 9th of April to procure offers from any persons other than those two gentlemen?—A. I made none.

Q. And these offers were not obtained on any public advertisement, I infer?—A. No, sir.

Q. Had you told both of these gentlemen that you would like to have them give you the price at which they would furnish granite?—A. I think I had.

Q. Why not to any other persons?—A. I knew that they were the only persons able to furnish and deliver as wanted.

Q. Did not Mr. Morris call upon you between the 20th of December, 1867, and the 9th of April, 1868, and endeavor to negotiate or desire an opportunity to put in a proposal for furnishing granite?—A. No, sir; on the contrary, he told me that he had abandoned his quarry and was going into other business.

Q. When did he give you that information?—A. About that time.

Q. About what time?—A. Between the 20th December and the next April.

Q. Can you not give any more definite idea as to when he gave you that information?—A. No, sir.

Q. Are you sure it was before the 9th of April?—A. Yes, sir.

Q. How came he to give you that information—did you call upon him or he upon you?—A. I called upon him.

Q. Do you know Dr. C. De Montreville, of St. Paul?—A. Yes, sir.

Q. Did he tell you that he was the president of a company owning any granite ledge?—

A. He informed me that he had a gold mine, he thought; that he was exploring after gold in a granite ledge; he showed me some specimens, and said that if he did not get gold he would have good granite.

Q. Where is his ledge?—A. At Watab.

Q. Was not the name of the company the Watab Company?—A. I never heard the name of the company, though I know Dr. De Montreville very well.

Q. Did he not furnish you with what purported to be a resolution adopted by the company offering and presenting as a free gift to the Government all the granite that it might need for the construction of the custom-house at St. Paul?—A. That is the first that I ever heard of any proposition of that kind.

Q. When was it that he called upon you and spoke to you in reference to the granite belonging to this company?—A. He never called on me at all; what he said was simply at some casual meeting.

Q. When and where?—A. I think on the steps of his office; I have apartments adjoining his office, and we often meet; I should suppose it to be there or on the street; it might have been at either place.

Q. When?—A. I think it must have been some time in the fall of 1867.

Q. Did you not give him the figures as to the amount of granite you would probably need, telling him when bids should be put in, if bids were put in?—A. I do not recollect anything of the sort; it is a thing I never heard of before.

Q. Do you know Charles Simons, of St. Paul?—A. Yes, sir.

Q. Did he ever call on you with regard to furnishing granite?—A. Not to my recollection.

Q. Did you ever inform him that proposals would be advertised for furnishing granite, and that he should have an opportunity to bid, if he desired?—A. I may have done so; if he asked me, I presume I did.

Q. Did he not have interviews with you, desiring to make proposals, as late as April 1868?—A. I do not know that he ever called upon me in respect to this subject. He has been in the office; whether, when there, he conversed on that subject I do not remember.

Q. Do you know whether Mr. Simons had any granite ledge, or any arrangements with the owners of a granite quarry?—A. I have no knowledge on that subject.

Q. Where is Watab; how near to the quarry from which you are now obtaining granite?—A. About twenty miles, I think.

Q. How far from St. Paul?—A. About eighty-five miles.

Q. Is it on the same line of railroad?—A. It is not on the line of the railroad.

Q. How near is it to the railroad?—A. About ten miles, I should say.

Q. Are you acquainted with Mr. Newson, of Watab?—A. I have seen him.

Q. Did he not call on you and desire an opportunity of making a bid to furnish granite?—A. I think he spoke to me in regard to the matter one day on the street.

Q. When?—A. I think some time before the letting.

Q. Can you fix the time any more definitely?—A. A month or two months before, I think.

Q. How often did he call on you?—A. I do not recollect his mentioning it more than once, though he may have done so.

Q. What did you say to him?—A. I presume I said to him substantially the same as I did to the others.

Q. What was that?—A. I may have said that advertisements would be made for bids.

Q. And all these gentlemen, Dr. De Montreville, Mr. Simons, Mr. Newson, and Mr. Morris, had interviews on the subject, and expressed their desire to make bids for granite before the 9th of April?—A. I think very likely they did. I do not think, however, that De Montreville made any offer to furnish granite; I have no recollection of it.

Q. After you received the letter of the 9th of April, did you call upon any of these gentlemen and offer them an opportunity to make a bid for furnishing this granite?—A. No, sir; only Delano and Morris.

Q. Did you see Morris after receiving that letter?—A. Yes, sir.

Q. But he had before that informed you that he was out of the business?—A. Yes, sir.

Q. And the only persons that you spoke to in regard to granite were Morris and Delano?—A. Yes, sir.

Q. After you had made the contract with Mr. Delano, did not Mr. Newson call upon you and ask you why you had not given him an opportunity to bid?—A. Not that I know of.

Q. Do you recollect telling him that the contract had been let privately and under instructions from Washington?—A. I have no recollection of it.

Q. Were your instructions such as precluded your advertising or making efforts to procure proposals lower than those of either of these two gentlemen?—A. No, sir.

Q. Then the question returns: why did you not endeavor to get proposals from one or the other of those gentlemen who had spoken to you on the subject, instead of concluding a contract without giving them any such opportunity?—A. Because, in my judgment, that was the only available quarry; and the stone could not be procured anywhere else at so low a figure in time for that year. I was under instructions to push the building vigorously.

Q. When was it necessary that you should have the granite for the building?—A. We wanted to get it in May, if possible; but we found that it took still longer than that.

Q. When was the first granite put in the building?—A. It was the latter part of June before any granite was cut, and it was still later before any of it was put into the building.

Q. How much later?—A. I think not till October.

By Mr. ELA:

Q. Was there a change made in the granite after commencing the work?—A. Yes, sir.

Q. You opened a new quarry?—A. Yes, sir; and then changed back to the original, which we are working now.

Q. How did you make your contract for cement?—A. We made no written contract.

Q. Did you invite proposals?—A. Yes, sir.

Q. Did you not in every case invite proposals where the articles would be furnished by persons living out of St. Paul?—A. Yes, sir.

Q. Did you in any case invite proposals where the articles could be furnished by St. Paul people?—A. I do not recollect about that particularly.

Q. Is there anything that you purchased in St. Paul for which you invited competition?—A. I do not recollect.

Q. Is there anything that you purchased outside of St. Paul for which you did not invite competition?—A. Yes, sir; there were stone-cutters' tools and a great many other things of that kind; we also advertised for proposals for furnishing the brick.

Q. Did you not on the 26th of October write to Mr. Mullett that the limestone ledge was all stripped, so that you could now get limestone at a low rate?—A. Yes, sir.

Q. Why did you not continue getting limestone at that low rate after the ledge was stripped?—A. Because after that I concluded that it would be best not to bring any more rubble rock, as we call it, on the ground. If I had continued quarrying myself the next season, (1869,) I would necessarily have accumulated a large amount of rock for which I would have had no use, and which would have had to be removed afterward. So I concluded to purchase exactly what we did want of the quality we wanted, finding I could get it at a less figure than it cost to quarry it.

Q. I see by your letter of December 2, 1868, that you paid, for stripping the ledge, so that you could get at the rock, $3,679 76?—A. Yes, sir.

Q. And that, taking that expense into consideration, (as I see it is taken into consideration,) the total cost per foot of stone is 21½ cents per foot?—A. Yes, sir.

Q. Now, after you had been to all this expense of stripping, over $3,600, what reasons induced you to contract elsewhere for stone at 35 cents per foot?—A. I suppose it was because I wanted more stone than came from the quarry.

Q. Did you not excavate more stone than you needed?—A. Not of the kind we needed.

Q. Did you not, on the 6th of April, advertise to sell a thousand feet of stone?—A. I recollect writing that there were surplus stone not needed in the building, and recommended their being sold.

Q. Did you not write that there were a thousand feet to be sold?—A. I do not remember the quantity; I know I have sold no stone.

Q. Whether you sold any or not, did you not write a letter showing that the rock you quarried cost you less than 21½ cents per foot, including $3,680 for stripping, and after the stripping was all done make a contract for stone at 35 cents a foot?—A. I contracted for that stone cheaper than any other contract.

Q. That is not the question; did you make a contract for stone cheaper than it was costing you to quarry it?—A. I did, according to my calculations.

Q. Did you not make a contract for stone at 35 cents per foot?—A. Yes, sir.

Q. Did you not make a correct report here when you said that the total expense, including $3,679 for stripping, was but 21½ cents per foot?—A. Let me look over it a moment, please.

[Witness reads the letter and hands it back.]

Q. Is not that your letter?—A. Yes, sir.

Q. How much does it say has been the total cost of the stone, including all expenses for stripping, quarrying, hauling, &c.?—A. Well, it seems to be 21½ cents per foot here. I do not quite understand that myself; there may be some error in the calculation. My idea was that it cost over 40 cents per foot.

[At this point Mr. Mussey, attorney for the Supervising Architect of the Treasury Department, made a remark to the witness, whereupon the latter added:]

Mr. Mussey reminds me of a fact which I think will explain this apparent discrepancy. This letter refers to all the stone found in the excavation. Now, as I have explained, a large amount of it was worthless for the purposes of our building; much of that stone is not worth over $3 a yard, and similar stone could be bought for that. The 21½ cents a foot is set down as the average price per foot of the aggregate, good and poor together—by far the larger portion of it being poor. The best of it would have cost 40 cents a foot; but the most of it was of a much inferior quality, and could have been bought for 10 cents a foot, or 8.

By Mr. HAMBLETON:

Q. I do not think I understand exactly the condition of the rock in that quarry.—A. I

will endeavor to illustrate it to you by means of a diagram. Our quarry was, say 30 feet square, or not far from that; and let this represent a vertical section. First, we find 18 or 20 inches of dirt; then we come to stone, not in layers, broken into every shape and mingled with dirt; this extends downward for about 6 feet. Then we come to this first-quality rock in layers, about 3 feet deep; then we come to 3 feet more of comparatively worthless rock, and below that is 4 feet more, or thereabouts, of pretty good rock; but quarrymen generally do not take it out because it costs more than the rock is worth to strip off the poor rock that lies above it.

Dirt, 18 inches.
Broken stone, not in layers, fit only for rubble-work, 6 feet.
First quality rock, 3 feet.
Comparatively worthless rock, 3 feet.
Good rock, 4 feet.

By Mr. ELA:

Q. This ledge is in the center of St. Paul?—A. Yes, sir.

Q. Within a stone's throw of the State House?—A. It runs under the State House.

Q. And the stone you used is the same as is used in the other buildings in St. Paul?—A. No, sir—better; they use very poor stone sometimes. You will see many buildings not yet six years old, the stone of which is disintegrating and dropping out.

Q. Are not the school-houses, and other of their finest buildings, constructed of this material?—A. All the work that is much exposed is taken out of this best strata. Some of the other stone looks well, but is not durable. The good and poor stone, all reckoned together, would have cost 21 cents. The best quality of stone would have cost 40 cents. It was for stone of that kind I paid 35 cents. If they had brought anything else it would have been rejected.

Q. How many different concerns are at work in that quarry?—A. I think, five; the firms at work there are constant y changing.

Q. The contract is to deliver the stone on the ground?—A. Yes, sir.

Q. Is the stone that has been delivered satisfactory?—A. Yes, sir; all that I have accepted. What I have rejected I have not paid for, of course, so that makes no difference.

Q. What are the superficial dimensions of your quarry?—A. I cannot say, exactly; I should judge about 30 by 34 feet.

By the CHAIRMAN:

Q. Did you make any examination yourself of the different quarries of granite, or ledges, in the neighborhood of St. Paul?—A. I went all over that country; probably, for a radius of half a mile from where they were working.

Q. How many different ledges would that include?—A. They are all connected, excepting one, which lies outside of that, and part of that deep under ground.

Q. All owned by the same persons?—A. Yes, sir.

Q. So all the quarries you examined were the quarries of the Minnesota Granite Company, except one?—A. Yes, sir; and I don't know but they owned that. I deemed the one which I contracted with to be the only available quarry. It is very expensive to haul granite ten or fifteen miles by wagons, transfer them to railroad cars, &c.

Q. This quarry that you did contract with—how near is that to the railroad?—A. The railroad runs right into it. The main track runs within a hundred yards of the quarry, and a spur track has been built right into the quarry.

Q. What is the cost of transporting the granite?—A. The railroad company charges a tariff of 15 cents per foot, delivered at the depot in St. Paul.

Q. What would be the cost per cubic foot of delivering granite from this Watab ledge eight or ten miles away from the railroad at the nearest point?—A. That is a question I could not very easily answer. It would be necessary to know the exact distance, to find out how much granite could be hauled by a given number of men and teams in a given time, how many men it would take to unload from the wagons and load upon the cars, &c.

Q. Do you know what the cost of quarrying is reckoned at by the Minnesota Granite Company?—A. I do not. I know they claim to have lost between $5,000 and $7,000 on our contract.

Q. On the amount of granite already delivered?—A. Yes, sir.

Q. Has any person, since the making of the contract, proposed to furnish granite at any less price than that named in the contract?—A. No, sir; no such proposition has been made.

Q. Or intimated a desire to be permitted to make proposals for furnishing it?—A. No, sir; Mr. Morris has only expressed himself as being thoroughly glad that he didn't get the contract.

Q. When did he express himself to that effect?—A. Some time during the winter—perhaps last fall.

Q. Since the making of this contract?—A. Yes, sir; since a large amount of the granite has been delivered.

By Mr. ELA:

Q. Does he own the same ledge he did when he made the proposition?—A. I think he *never* owned it.

Q. How are you having the granite for the custom-house dressed?—A. By contract with A. H. Wilder.

Q. In writing?—A. Yes, sir. (Witness identifies the contract.)

Q. What was the price per foot?—A. There are a good many different prices, as there are a good many ways of dressing stone.

Q. What would be the average price per foot?—A. It would require a good deal of calculation and figuring to come at it.

Q. Do you know Samuel B. Brown, of St. Paul?—A. Yes, sir.

Q. What is his business?—A. When I come to think, I believe he lives in Stearns County, somewhere near St. Cloud; he is a stone-cutter.

Q. Did he ever make any proposition to you to dress this granite for the Government?—A. No, sir.

Q. Nor offer to take a contract for getting out granite at 40 cents a foot?—A. No, sir.

Q. Nor any offer of any kind?—A. No, sir.

Q. Did you advertise for proposals for dressing granite?—A. No, sir.

Q. Or make any effort to procure proposals?—A. No, sir, not relating to *this* contract; originally we did advertise.

Q. When was that?—A. In April 1868—possibly March.

Q. Did you receive any proposals under that advertisement?—A. No, sir.

Q. What proposals did you receive?—A. None. Mr. Mullett received some here and awarded the contract; there were no granite-cutters in Minnesota, except, perhaps, this man Brown and two or three others; and Brown said he had been out of the business for sixteen years, and had no desire whatever to bid.

Q. Then you received no bids at St. Paul, and whatever was done was done here at Washington by Mr. Mullett?—Yes, sir.

Q. With whom was the contract made?—A. With the firm of John Stuart & Co.

Q. What did they do?—A. They went to St. Paul and commenced work. The contractors for the rough granite had not got so far along in the quarry as they expected on account of the stone being so hard, and were on the point of abandoning the contract, but I went to the quarry with them, and we looked it over, and we came to the conclusion that by moving to a different place we might find a ledge that would work more easily. The removal was made, finding a little rock that could be worked. They concluded, if enough of that could be found, they would remain and endeavor to carry out the contract. But that quarry had to be abandoned; the material became exhausted; they came to a kind of mixed granite, red and blue. After trying in two or three places, they went back to the first quarry opened, and took some more out of that. They afterward struck a very superior quarry of granite; though very hard, it was very nice. Afterward, however, they abandoned their contract.

Q. Why were they not held to it?—A. They could have been sued, I presume, and forced to pay a penalty, but they were broke.

Q. You do not know whether any efforts were made to compel them to execute the contract or pay damages?—A. No, sir; we were extremely anxious to get the granite cut, and did not want to lose those men.

Q. Did they refuse to go on, or did you assent in any way to their giving up the contract?—A. I do not think I did. They abandoned their contract, and so informed me. I had nothing to do but either to enforce the terms of the contract or assent to their abandoning it, which I afterward did.

Q. Then you did consent that they might give up the contract?—A. Yes, sir.

Q. What was then done?—A. I then prosecuted the work by days' work.

Q. Where was the dressing of the granite done?—A. At St. Paul, on the custom-house site.

Q. What was the expense of dressing it when the work was done by the day?—A. It turned out to be considerably more than under their contract.

Q. Do you remember how much per foot?—A. I do not.

Q. How long did you continue the work of dressing by the day?—A. Two or three months, I think.

Q. Then were any proposals made for bids for dressing?—A. No, sir.

Q. What did you do?—A. I received the proposition of Mr. Wilder to do work by contract, which proposition I forwarded to Mr. Mullett, and it was rejected. Wilder was very anxious to do the work, and made another proposition, and I do not know but a third. When he got down to a fair figure the contract was awarded to him.

Q. How did the prices in the Wilder contract compare with the prices under the original contract with Stuart & Co?—A. They were considerably higher.

Q. How much higher; what per cent.?—A. I could only guess; they are cutting on work such as Stuart & Co. did not cut on.

Q. Still that work was on their schedule?—A. Yes, sir.

Q. Well, to the best of your judgment, how do the prices compare?—A. I should say about 15 per cent. higher.

Q. That is the average of the different kinds of cutting?—A. I should judge so.

Q. Can you give the schedule prices as contained in the Wilder contract, and also in the Stuart contract?—A. Is the Stuart contract here? I could, with the aid of that. (After examining certain papers, witness continued.) The difference is the difference between $66,000 and $98,000; about $32,000 for the whole building.

Q. Have you figured the difference which cutting would amount to under the two contracts for the whole building?—A. No, sir, I have not; that is done in this office here.

By the CHAIRMAN:

Q. Have you no idea of what the difference in cutting would be under the Stuart contract and under the Wilder contract?—A. I should suppose about twenty-odd thousand dollars.

Q. That is, the dressing will cost that much more under the Wilder contract than under the Stuart contract?—A. That is my idea, upon a rough calculation; I believe I never figured up the total of the Wilder contracts. Stuart's contract is drawn for a specific sum; Wilder's is not. I have here a telegram which I sent to Mr. Mullett showing the expenses under the different contracts:

[Telegram.—Dated St. Paul, Minnesota, April 4, 1870. Received at Washington, D. C., April 4, 6.03 p. m.]

"To A. B. MULLETT,
"*Supervising Architect, Washington, D. C.:*

"Days' work dressing granite, including blacksmithing, labor, teaming, iron, steel, coal, &c., $19,273 69; sheds, $650 68.

"J. Stuart & Co.'s contract, $5,345 40; tools, &c., $1,119 50.

"A. H. Wilder's contract, $79,105 93; total cost, $105,494 60; amount done, $75,213 77; balance to be done, $30,280 83.

"A. T. KNIGHT,
"*Superintendent.*"

Q. Then the dressing of the granite, as you now estimate it, will cost $40,000 more than the original contract price of John Stuart & Co.?—A. Yes, sir But there is somewhere an estimate in this contract which, I think, is not embraced in the Stuart contract for inside stairs, which amounts to several thousand dollars.

Q. How much? several thousand dollars is very indefinite.—A. It is impossible for me to say.

Q. The original proposals of Stuart were for $86,794 51?—A. I never had the original proposals of Stuart & Co.

Q. Stuart & Co. were experienced stone-cutters, were they not?—A. Yes, sir.

Q. Then please explain how it is that the dressing of the granite for this building is likely to cost nearly $40,000 more than what these experienced gentlemen were willing to take the contract for in 1868?—A. Simply because those contractors broke and no others could be found to take it at that figure. It was afterward let by contract, to relieve me of some work, and to insure its being pushed through the winter. I want to add that the sample of granite sent here was not a fair specimen of the granite from that quarry; it was softer than the rest of it and these men based their proposal upon that sample.

By Mr. ELA:

Q. Did Stuart & Co. make any other complaint except that the eight-hour law embarrassed them?—A. That was the greatest complaint.

Q. Was there any other?—A. Yes, sir; they complained of the hardness of the granite.

Q. Were they not ready to go on, if the treasury would advance 25 per cent.?—A. I heard some talk about that.

Q. Did Wilder propose to you to make a private contract for the stone work lower than the contract that was made?—A. He spoke of wanting to bid for this contract before it was made?

Q. Did not Wilder submit to you a proposition for a private contract?—A. No, sir.

Q. Did you ever see a proposition of his to do this work, excepting the one where he made the bids out of which this contract grew?—A. No, sir.

Q. Did he, or did he not, make a proposition to do this work on the 4th of December, 1868?—A. Not that I know of, sir.

Q. Did he transmit such a proposition?—A. I cannot say; I think not.

Q. Will you say whether that proposition (handing witness a paper) is higher or lower than the contract made with Wilder; and, if so, how much?—A. I do not recollect ever seeing this, sir; I do not think I ever transmitted it; I may possibly have done so, but I have no recollection of it.

Q. Can you tell me why a contract was made with Wilder at prices higher than he had before proposed to do this same work for?—A. I do not know as they are higher in the aggregate.

[The examination here assumed an informal and conversational style, the chairman of the

committee leaving, and the other spending a few moments in comparing Wilder's proposition of December 1868 with the terms of the contract entered into with him in April 1869; after which the committee adjourned.]

WASHINGTON, *April* 13, 1870.

B. F. KNIGHT; examination continued.

By Mr. ELA:

Question. Can you tell by casual observation and comparison how large a proportion of the prices upon that schedule are higher than the prices upon this proposition, and how much the aggregate would be?—Answer. I do not think I can; there are so many items to be taken into consideration. Any guess that I could make would be so far from accurate that it would not be of much practical value. Besides, there are many items in there which were already completed when this contract was made. The first item I strike, the area coping, in this proposition was offered at $2 10 per lineal foot; the price in the bid is $2 25. For quoins in the proposition, the offer is $1 93; the price in the bid is $2 60. These articles are not in the same order, and it would take a long time to go through with it in this way.

Q. Do you know anything about this proposition?—A. No, sir; I never saw it or heard of it until it was presented here to-day?

Q. When the contract was finally made, what course was pursued? Was any competition invited?—A. An offer was made, which was finally accepted; it was not in the shape of a bid; but the party who had before presented a bid, which was rejected, finally made a much lower offer—an offer lower than we could get elsewhere, and we accepted the offer.

By the CHAIRMAN:

Q. Did you state how much cheaper the work could be done under Wilder's offer than you could do it by the day?—A. In my opinion, some five or six or seven thousand dollars cheaper. I made some figures on that, and have no doubt of it.

Q. In your judgment, how much has the expense of the building been increased by the delay to furnish rough stone?—A. I think there has been some delay.

Q. I see from this correspondence that heavy expenses have been alleged to have occurred from not getting granite promptly?—A. I recollect the fact that we at first could not get granite as fast as I thought it ought to be furnished. This was owing to the fact that they could not get stone-cutters.

Q. But has not your main difficulty been in getting granite for the cutters?—A. There has been some delay on that account. I might have got along faster with the work, and it might perhaps have been less expensive, but for that.

Q. How much?—A. Exactly how much I cannot say; not a great deal.

Q. How much in your judgment?—A. Two or three hundred dollars. At first they had but three cutters at work; one or two others came afterward. However, we were not quite ready for the granite. We did the best we could. The delays were such as might have occurred on any piece of work.

Q. Who superintended the granite cutting while it was being done by the day?—A. I did.

Q. Was there any delay or failure in pressing forward the work as rapidly and cheaply as possible while it was being done by the day?—A. Every effort was made—perhaps greater than at any other time. We were greatly in need of it to push the work.

Q. I understand you to say that Mr. Wilder submitted to you a proposition for doing this work, which was changed and reduced in amount before you finally closed a contract with him?—A. Yes, sir.

Q. Did he, at any time, offer you a lower price than the one at which you finally closed the bargain?—A. No, sir; every other time it was higher. The two former propositions which he made were each higher than the one which was finally accepted, by considerable. The second was not very much higher; it was higher in some respects, and in no respect lower.

Q. Was there any effort or intention on the part of any one to have the work made expensive while it was being done by the day in order to pave the way for a better contract?—A. Nothing of that sort was done that I know of; and if there had been it could not possibly have effected anything, for I myself was entirely responsible for it.

Q. Have you ever heard it suggested by any one at St. Paul that such a course had been pursued?—A. Yes, sir.

Q. When did you first hear such a suggestion?—A. Perhaps two weeks ago; possibly three.

Q. Did you hear anything of the kind at the time this contract was made, or before, or within months after the contract was made?—A. No, sir, I did not; I had no idea of it.

Q. Was there ever any gift, or reward, or consideration of any kind, offered to you or to any other person to your knowledge, in connection with any of the contracts which have been made for material or labor upon this building?—A. Never, sir.

Q. Nothing of the kind by any one?—A. I have never received anything.

Q. Has anybody ever offered you anything?—A. No, sir.

Q. In any way whatever?—A. No, sir.

Q. Is any one interested in any way in these contracts, so far as you know, other than the persons whose names appear on the contract?—A. Not so far as I know.

Q Has any one an interest, so far as you have ever been informed?—A. Only by hearsay.

Q. What is that hearsay?—A. I believe these parties represent the so-called Minnesota Granite Company; but I have no knowledge of it—I mean Wilder. I understand him to be one of the members of the Minnesota Granite Company.

Q. Who compose, so far as you know or have heard, the Minnesota Granite Company?—A. I believe there are about thirty of them; Wilder, Delano, Carver, Prince—I am not sure of the names of any of the others.

Q. Have you heard other persons named as being interested?—A. I believe I have; I met a gentleman from Cincinnati who informed me he was a stockholder; I forget his name; he is a man about thirty years old—perhaps thirty-two or thirty-three; he went up to the granite quarry with me one day.

Q. Are any more of them residents of Minnesota?—A. I believe a half dozen or dozen of them are residents of St. Paul. I have heard their names, but do not recollect them now. It was a matter that did not interest me, only so I got the granite, so I paid little attention to these other matters.

Q. Have you ever heard it intimated that any person who is, or who has been heretofore, a member of either house of Congress, was interested in the limestone or granite or any other contract in connection with the building? I ask because I observe intimations of that kind thrown out.—A. My belief is there is no truth in them.

Q. Has any person ever intimated to you a desire that you would contract with one person rather than another, or make a contract in one way rather than another with regard to this building?—A. No, sir.

Q. Are the plans for this building completed?—A. I believe they are, but they are not all in my possession yet. I think I have seen in Mr. Mullett's office full details, which I have not.

Q. What will be the additional expense of completing this building according to the plans which have been adopted?—A. About $220,000, or in that vicinity.

Q. Could not money be saved to the Government by having this building put up by contract, instead of having the work done by the day as it is being done now?—A. I do not know; it might be.

Q. Has any builder or any person ever intimated to you a desire or readiness to bid for the completion of this building or any part of the work?—A. Yes, sir. A painter wished to bid for the painting, but I informed him it was to be done by days' work.

Q. Is that the only offer?—A. I think so. We are not far enough advanced to have the painting done.

By Mr. ELA:

Q. What is the original estimate of the cost of this building?—A. I have never seen the estimate.

Q Do you know how much has been already expended upon it?—A. I think $159,000.

Q. How much granite will you require in all?—A. I cannot tell how many feet it will require; I think the whole cost will be less than $15,500.

Q. How long have these parties been in furnishing this?—A. They commenced immediately after the contract was let—in April, I think.

Q. Do you know any good reason why they should keep you waiting for granite?—A. There is always difficulty and delay in opening up a new quarry.

Q. But having opened the quarry, what was the difficulty in keeping you supplied?—A. The difficulty, I think, arose from these stonecutters; the granite was so hard that it was the universal opinion that it could not be cut. The top of the quarry had been seasoning for ages, and was so very dry and hard that in cutting it, as soon as an attempt was made to finish it down, out would jump pieces perhaps as large as a dime or a quarter, and an eighth of an inch deep, more or less. This would necessitate dressing it all over again, and that without the probability of coming out any better next time; so they thought they would try the experiment of getting granite in another place. There was considerable time lost in moving and experimenting, and after all they came back to the old place and tried again.

Q. As I understand you, the men who furnished the stone and who did the cutting were substantially the same parties?—A. O, no, sir.

Q. Is it not so now?—A. Yes, sir; it is so now.

Q. Mr. Wilder, the contractor for the granite, is also the man who furnishes the stone?—A. Yes, sir, at present; but then, Stuart & Co. were contractors for the cutting, and had no relation to these parties that I know of.

Q. Need there have been any difficulty in their furnishing you granite?—A. I think it was very difficult to do under the circumstances.

Q. What circumstances?—A. Owing to the dissatisfaction of the granite-cutters.

Q. But were not the granite-cutters the same men who furnished the stone?—A. Not then.

Q. In all the work done in 1869, were not the men who furnished the stone and those

who cut it substantially the same parties?—A. They furnished as fast as required, last year.

Q. But this letter says: "I note what you say in regard to the delay and the cost incurred through want of prompt delivery of the granite. I cannot refrain from expressing my astonishment that you should assign such a reason as an excuse for *excessive cost of work* done under your supervision, seeing that the conditions of the contract give you full power to take such action as you deem fit to *com[pel the furnishing of] a sufficient supply of material."—A. That was in the spring.

Q. No; the letter is dated August 2, 1869.—A. Wilder, at that time, was doing pretty well. What I have been speaking of more particularly is the delay at the very commencement.

Q. You have said that the Government lost perhaps $200 or $300 by the delay in furnishing stone; would it not have required a larger loss than that to have induced Mr. Mullett to speak in this manner of the "excessive cost?"—A. No doubt it would. I may add, Mr. Mullett told me to estimate the loss, and charge it against them, to come in on final settlement. I am sure I do not know of any measure I could have taken that would have produced the granite any faster.

Q Where do you get sand?—A. From the river.

Q. I see here a complaint at the cost of getting sand.—A. There is no cost except shoveling it up and hauling it.

Q. How far do you have to haul it?—A. About a mile.

Q. How much does it cost?—A. It did cost $1 58 a yard; a yard is about a load. There was a short time when the river could not be got at, owing to the high stage of water; then I paid for some sand; but as soon as the water subsided we took sand from the river again.

Q. How much did the sand cost that you bought?—A. Ten cents a load, I think.

Q. How do you haul it?—A. In the winter we haul it on the ice; but in the summer we have to haul it across the bridge, which makes the distance considerably greater.

Q, How many teams have you had hauling sand?—A. I do not recollect.

Q. How many trips a day do they make?—A. Six trips a day, I think.

Q. How much have you paid for these teams?—A. Four dollars a day, perhaps four and a half for some of them; this includes a man and team. Then we keep a set of shovelers there, to load the teams. A couple of shovelers will keep three or four teams running.

Q. Have any arrangements been made for plastering?—A. No, sir.

Q. What is the estimated cost of plastering?—A. Forty-four or forty-five cents a yard; this includes the finishing, and everything; we propose to have a hard finish, with plaster of Paris. Forty cents is the price there for the best ordinary work.

Q. What is the price for labor in St. Paul?—A. $1 75 to $2 per day; the railroads pay $2, but work their men eleven hours Building laborers are getting $1 75.

Q. For how many hours' work?—A. Ten, usually; but we have to pay the same price for eight. However, we have the pick of the men, on account of that two hours' less work.

Q. What is your judgment in regard to finishing this building; would it be better and cheaper for the Government to go on and have the work done by the day, or to have the different departments put under contract?—A. I believe work can be done as well under contract as by the day. If I should continue to be superintendent, I should much prefer to have the work done by contract; it would not be one-twentieth the labor for me; at least, nowhere near so much

Q You could secure its being properly done?—A. I think so; but I should insist upon being allowed the same discretion as in other matters, namely: the privilege of not letting the work to men who I knew beforehand could not or would not do it properly. We have many mechanics in the West, as I suppose there are everywhere, who cannot do first-class work; who, in fact, do not know the difference between first-class and second-class work.

Q. Has there been any such discretion exercised?—A. I always exercise it in my own private business.

Q. I mean, has there been any such discretion exercised in this case so far as bids are concerned?—A. I cannot say that there has.

Q. Has there been any competition in that respect?—A. No, except as I have said before; there have been men who have spoken about it, but in such a way as to indicate that they did not regard it as a matter of any consequence.

Q. Why not?—A. Because they were not in business and had no facilities whatever for supplying the stone.

Q. Are you acquainted with a man by the name of Carver, who is connected with the St. Paul Press?—A. I do not think he does any business in connection with the Press itself; I believe he was a stockholder in the paper. He knows nothing about the granite business any more than others. Mr. Delano does; he is a thorough business man.

Q. Is that limestone quarry owned entirely by Davidson?—A. I believe so.

Q. Why not advertise for bids, so that Mr. Newson might have had an opportunity to bid?—A. Because of the necessity of saving time. If you go back among the letters from he start, you will find that Mr. Mullett was continually urging me to prosecute that building, and, if possible, get it under roof the first season.

---

* The letters and words in brackets not in the original letter.

Q. But Mr. Newson applied for an opportunity to bid, and how would it have delayed the construction of the building to have given him that opportunity?—A. I do not believe that Mr. Newson had any intention of making any *bona fide* bid.

Q. Yes, but Mr. Mullett wrote to him that he should have an opportunity to bid.—A. Well, if I had known that, he should have had.

Q. Mr. Newson complains that after going to you three times and requesting an opportunity to bid, he wrote to Mr. Mullett making the same request, and that Mr. Mullett wrote back to him that he should have an opportunity to bid; but that no opportunity was given him; that the first he knew the granite contract had been let, the first information he obtained being from a notice in the newspapers that the ledge was being opened.—A. I do not recollect his calling upon me in relation to the matter.

Q. He states that he went to see you three times.—A. He may think so.

Q. He goes further than that, and says he can prove it.

By Mr. GRISWOLD:

Q. You think this man was not prepared to take any contract?—A. I am quite certain of it.

Q. You had that idea at the time?—A. Yes, sir.

Q. How came you to that conclusion?—A. He informed me that his quarry was ten or twelve miles back from the railroad on which the granite would have to be brought; the quarry from which we are taking the granite lies directly on the railroad.

Q. How far from it?—A. The railroad passes right through it—over the lower part of it; the quarry is upon the side of the hill above it, so that the rock have only to be brought a short distance, and that down hill, in order to reach the railroad. Mr. Newson would have to transport his granite by teams for a dozen miles, which would add greatly to the expense; consequently he would have to charge that much more for his granite than we could get it for from this other place.

Q. That is the way you reasoned?—A. Yes, sir.

Q. And you barred him out, because you thought he would not be able to make a bid as low as Mr. Delano?—A. I could not conscientiously have recommended the adoption of his bid, if it had been lower than the one which was adopted. If he had agreed to furnish granite, there would have been no end to the delays.

Q. Have you any reason to believe that he would have delayed you more than the present contractor has?—A. I have every reason to believe so.

Q. Why?—A. Because, as the granite would have to be hauled nearly a dozen miles by teams, over roads almost impassable in wet weather; besides, the owner of the quarry from which we are obtaining granite is superintendent of the railroad, and might have refused altogether to take granite as freight.

Q. Would he be likely to do that?—A. The railroad have done that with wood, and I do not know why they might not do it with granite. But my main point was, we must have the granite so as to commence work immediately. I regard it as a very favorable contract; there is no place in the United States, that I know of, where the Government has been able to get so good a contract, even in old granite quarries which have been worked for years by men of skill who understand the business thoroughly.

Q. You say you advertised for brick; why could you not advertise for granite as well as for brick?—A. because we did not want the brick for some time.

Q. How soon did they begin to deliver granite?—A. Some time in June.

Q. Did you not advertise for 41,000 brick to be delivered in June?—A. Yes, sir.

Q. For what length of time did you advertise?—A. We advertised ten days.

Q. This advertisement was inserted, it appears, on the 17th day of May, and you required your bids to be in on the 22d?—A. Yes, sir.

Q. That is not ten days?—A. No, sir; that was an error of mine; I did not notice it until after it was printed; I corrected it in the next issue.

Q. But were not all the proposals in, within those five days?—A. I corrected it, I forget whether in print or with the parties themselves.

Q. Two of these bids are dated May 21, another May 22; how could you correct the error when these bids were already in? Here are seven bids offered inside of five days.—A. My instructions directed me to advertise for ten days, but by some oversight I made this mistake; I know I corrected it in some way.

Q. That is not the point; if you could get seven bids for brick in five days, could you not have got some bids for granite in that time?—A. No, sir, I think not; I had made one mistake, and did not want to make two.

Q Did you not want to use brick before you did granite?—A. No, sir; only a few.

Q. Certainly you had from April until the 17th of May to advertise; in getting granite, all you have to do is to blast it out of the quarry and split it up. In order to get brick you have to prepare the yard, mold the brick, dry them, and burn them.—A. There are several brick-makers at Minneapolis and other places within a short distance of St. Paul.

Q. But did not all these parties who had stone to sell live within a short distance of St. Paul?—A. I think just this, that no granite could have been obtained from any other quarry so cheap as this.

Q. But is that any reason why you should not have invited bids?—A. The point was this: I was extremely anxious about getting granite as soon as possible; I was not so anxious about brick.

Q. How much did the whole amount of brick you wanted amount to?—A. Nine or ten thousand dollars.

By the CHAIRMAN:

Q. So John Stuart kept right on at the work after he gave up the contract?—A. Yes, sir.

Q. Is he still there?—A. Yes, sir.

Q. At what price?—A. He has been having $5 a day part of the time, and a part of the time $5 50; I am not certain what they are giving him now.

Q. Whom do you mean by "they?"—A. The company; he is now at work for Wilder.

Q. I see you gave him $5 50 while you were carrying on the work by the day?—A. Yes, sir.

Q. Was not that a high price?—A. I do not think it was too much for a man of his ability and knowledge of the business. He is an extra man; it would be difficult to find a better.

Q. Do you know whether or not this Minnesota Granite Company is a corporation?—A. I do not know.

Q. Have you ever had any interest in the company, directly or indirectly?—A. No, sir; none whatever.

By Mr. GRISWOLD:

Q. You said that the advertisement for this brick was published only five days, by mistake?—A. Yes, sir.

Q. And that you corrected it?—A. Yes, sir.

Q. How did you correct it? I do not understand.—A. I thought I corrected it in print, but I may have been mistaken. It may have been another advertisement that I corrected a typographical error in. I inserted this and did not discover that my instructions called for ten days' notice, until after the advertisement was in type. My clerk called my attention to it, and I in some way endeavored to correct the advertisement accordingly. I thought however, that five days' notice was amply sufficient. Just how the advertisement was corrected I cannot say.

Q. You were speaking of the owners of this granite, the parties with whom you contracted; their quarry is on the railroad, and they control the quarry?—A. Yes, sir; Mr. Delano is also superintendent of the railroad running to the quarry.

Q. And this quarry of Newson, you say, is some ten miles from the railroad?—A. Some seven or ten miles from where the terminus of the railroad then was; I do not remember the exact distance.

By Mr. ELA:

Q. And was this road going toward the quarry?—A. Yes, sir; it is four miles nearer to it now than it was then. There is a possibility of the track being laid to Watab this year, but it is not at all probable.

Q. Does the fact of Mr. Newson's quarry being further inland add to the expense of getting stone therefrom?—A. Certainly, sir.

Q. But might he not have been willing to have furnished the granite at less profit to himself if you had given him an opportunity to bid?—A. Possibly; but he is a man of no capital and I do not think he could have furnished granite at all at the price we are now paying for it. I do not believe any one could.

Q. This is your theory, then, that the expense of getting the granite out and to the building would be more than the price you are paying?—A. Yes, sir; I believe the present contractor, with all his advantages, is losing money.

Q. What is granite worth in the ledge?—A. I cannot say.

Q. Do you know what it costs to quarry it?—A. Without referring to any detailed estimate, I should say from 40 to 50 cents. I should not value granite in the ledge at more than 3 or 4 cents. It is the quarrying and transportation that make by far the greater portion of the cost.

WASHINGTON, *April* 21, 1870.

Mr. A. T. KNIGHT reëxamined.

Witness appeared before the committee and stated that he had read the transcript of the evidence which he had previously given before the committee, and desired to make a few corrections and additions, as follows:

On page 7 of the evidence, at the point marked "A" upon the margin: In explanation of this answer I wish to say that I meant that my attention was called to the fact that the pile at the quarry was being stolen from; I therefore commenced to haul that pile to the custom-house, where we had a night watchman. I forget whether I said that we had two large piles at the custom-house, one of the best of the stone not fit for facing and selected pile,

the other the poorest, which I do not think will be needed in the custom-house; and I hauled this other rock down there where the watchman could guard it.

Page 7, "B:" I should say that a certain amount of top surface is allowed as grout; I forget the exact amount. The remainder of the quarry that was worked by me was paid for at the rate of 3 cents per cubic foot for the a nount I took out.

Page 11, "C:" I change my answer to "Yes, sir. I consulted several of the stone quarrymen and stone-cutters; and their first prices, where they did not offer written bids, ranged from 45 to 75 cents per foot."

By Mr. ELA:

Q. Whom did you consult?—A. I consulted several—the firm of Heisler & Co. for one; I think Slick & Erd for another. I may have called on other firms.

Q. Why did you not invite bids by advertising?—A. I did advertise at the time I furnished those thousand feet or so.

Q. Did nobody offer to furnish limestone?—A. Yes, sir; Mr. Davidson.

Q. Who else beside Davidson?—A. Nobody, that I remember of.

Q. Have you a copy of that advertisement anywhere?—A. Yes, sir, I have it here. (The advertisement was submitted to the committee, showing that bids for limestone were advertised for in the St. Paul Press; in the advertisement the right was reserved to reject any or all bids. Witness stated that the advertisement was also printed in the St. Paul Pioneer.)

By Mr. ELA:

Q. Did you forward any bids to Washington, as directed in this letter of April 12?—I do not remember whether I did or not.

Q. You say that but one bid was received?—A. Not that I recollect of.

Q. About this stone that you hauled down to the custom-house—why did you not sell it instead of hauling it?—A. At that time I had no authority to sell; my first instructions were that the work should be done by days' work, and the surplus material, on the completion of the building, together with the tools, derricks, chains, &c., be sold at auction.

Q. You say that before you got down to the stone that was fit for ashlar there were six feet of less valuable stone; what was that stone worth at the quarry?—A. About 85 cents for 16½ cubic feet; that is a little less than $2 per yard. It was only fit for rubble, so called. There is a part of it that is not so valuable as that—worth, perhaps, not more than $1 per yard.

Q. When was this stone stolen?—A. I do not know; I presume in the night.

Q. Did you ever make any effort to find where it had been carried?—A. I do not know that I did.

Q. Why not?—A. I did not consider them of any very great value. I told my clerk that I wished he would keep a look-out and see whether any more of them were missing.

By Mr. GRISWOLD:

Q. Is it possible that anybody would steal stone?—A. Oh, yes, sir; it is Government stone, and they consequently considered it their own.

By Mr ELA:

Q. How much of this class of stone did you haul away from the quarry?—A. I do not remember how much; I should suppose 20 or 30 yards.

Q. And you paid more for hauling that stone than it would sell for on the grounds?—A. I think not.

Q. What did it cost you a foot to haul it?—A. It will be difficult to tell that, because it was hauled by the day; I should suppose 40 or 50 cents per yard.

Q. How much was it worth?—A. I suppose it was worth $1 a yard.

Q. Would it not be worth more than that on the lot?—A. I think not.

Q. Would it not be worth more on the lot than at the quarry?—A. I think not.

Q. Then why should you haul it from the one place to the other?—A. The only difference was it would be more secure.

Q. Now, have you not reported that it cost you 6 cents per foot to haul that stone from the quarry to the custom-house?—A. I may have done so; I do not remember. I suppose a man could haul about 10 yards a day; for this we would have to pay $5.

Q. That would be about 50 cents a yard?—A. No, sir; I do not think the hauling could possibly cost 50 cents a yard.

Q. Which would be correct, your estimates now or the report which you returned to the Department?—A. I presume that my report to the Department was correct.

Q. That report said 6 cents a foot, did it not?—A. I do not remember.

Q. Have you any idea how much of this refuse stone you have on hand now?—A. No, sir; I cannot carry all these things in my head. By referring to the report I can tell; it is a large amount.

(The examination upon this point being concluded, the witness proceeded to refer to further explanations and additions which he wished to make to his testimony which he had previously given.)

Page 13, "D:" By reference to the papers I find that I pay 35 cents per foot for the stone here referred to.

Page 15, "E:" Reference to the papers shows that it was advertised on the 22d of April, 1869.

Page 19, "F:" By referring to the papers I find that no advertisement for proposals for furnishing granite was published in any paper, the order that I received from the Department on the 9th of April being considered by me to require such expedition that the delay for the transmittal of proposals for approval was to be dispensed with and the matter left entirely to my decision, the limitations of the same being based on the bids already transmitted in the December preceding, which were named for my guidance in the contract.

Page 21, "G:" The testimony from "F" to "G" is altogether wrong. The advertisement for granite cutting was confused in my mind with the proposals for rough granite.

Page 22, "H:" The above remarks and the remarks opposite "H," on page 22, refer to the same thing.

Page 44, "I:" I will state here that I did not consider Mr. de Montreville nor Mr. Newson nor Mr. Simons as at all likely to undertake any contract for granite. Nor is the reputation of either of them as regards ability, experience, or means such as would warrant me in advising the letting of a contract to them. I therefore considered that the competition was narrowed down to such parties as possessed the means and facilities to provide the material. Messrs. Delano and Morris were the only parties offering. In April Mr. Morris refused to stand by his bid of the preceding December, and I succeeded in making what I considered a very favorable arrangement with Mr. Delano, as must be acknowledged by comparison of prices with those of any granite company in the East.

Page 45, "K:" This answer I would have, "No, sir; but I so understood them at the time."

Page 56, "L:" This answer should be, "I do not."

Page 75, "M:" Since reading the correspondence I would modify this answer, as it seems that a copy of Mr. Wilder's bid of December 4 was sent to me by Mr. Mullett and was received at my office during my absence East, and the fact that a bid had been made at all had thus entirely escaped my memory.

By Mr. GRISWOLD:

Q. What would be the whole amount of the cutting of this stone under Wilder's contract?—A. Ninety-two or ninety-three thousand dollars.

Q. Don't you think you could have got this limestone cut for less than 35 cents a cubic foot by asking for bids?—A. I do not think I could I did ask for bids, but the most of them wanted to furnish it right through, good and bad rock all together. For good rock such as we needed some of them wanted to charge as high as 75 cents. What I wanted was number one quality, such as occupied about 3½ feet in the ledge.

Q. Don't you think you could have got that stone drawn for less than $1 15 per yard?—A. It only cost about $1, I believe.

Q. Could you not have got it done for less than that?—A. Doubtful, I think.

Q. What has been your whole expense for sand?—A. I cannot tell exactly.

Q. Well approximately?—A. I should say between $3,000 and $4,000.

Q. That is for plastering and all?—A. Yes, sir.

Q. Does it go through any process before you use it?—A. No, sir; it is ready for use, cleaned and washed where we find it. Bank sand has to be washed; but we get our sand from a sand-bar in the river, or on the bank of the river where it is washed up; we haul it from there mostly in the winter on the ice; the road upon the ice is level, of course; from the river to the site of the custom-house is a little up hill; we had to haul some of it from a sand bank because the river was high; that cost us more than that which we obtained from the river. I think I have stated the distance that we have to draw the sand too small; I think it is nearer a mile and a half than a mile.

Q. Have you no idea that sand could be procured at a cheaper rate?—A. No, sir.

Q. In this account you include the opening of the quarry?—A. Yes, sir.

Q. Does it include the cost of the quarry?—A. No, sir.

Q. Does it include the cost of building this side track of railroad into the quarry?—A. No, sir; the railroad company built that at their own expense.

By Mr. ELA:

Q. Where did you haul this stripping when you stripped the ledge?—A. It was hauled on to the street.

Q. And when you cut down low enough so that some of the rock was fit for use?—A. The best of it was hauled to the custom-house site.

Q. Now in this letter of December 2 you report the cost of hauling that rock at $6 92 per foot?—A. I suppose that was the dimension stone probably.

Q. You have got here the cost of stripping at $1,185; that stripping you hauled into the road, did you?—A. The most of it.

Q. And this $6 92 was the cost per foot of hauling the good quality of rock?—A. Yes, sir.

Q. Would it not cost as much to haul the refuse rock as the other?—A. I think not.

Q. What was the difference between hauling that portion of the rock not used for facing and that which you used for facing?—A. I don't remember; I did not pay any attention to the matter whatever.

Q. In your judgment what would be the difference?—A. That would depend considerably upon the size of the stone.

Q. How large were your facing blocks?—A. They would vary from 2 to 4 or 5 feet square.

Q. And how thick?—A. From 10 to 15 or 16 inches.

Q. How were they loaded?—A. Partly by derrick and partly by hand; the derrick was mainly used for pulling rock out of the quarry: if the team was there when the rock was lifted it would be swung on to the wagon with the derrick; if not, it was more likely to be lifted on by hand or rolled on.

Q. What element of cost makes this class of stone more expensive to haul than the other?—A. It was more expensive to haul dimension stone than rubble stone, on account of its being more difficult to load. The first year we quarried, in the fall, we stacked up heavy dimension stone in the quarry, and did not haul it until next spring. Some of it was piled at a considerable distance from where the derrick was. In loading that, of course, it had to be loaded by hand. I cannot say from recollection whether a load of this cost more or less than the other.

Q. Have you ever sold any of this stone?—A. No, sir.

Q. This is the stone that you piled upon the lot you leased?—A. On the two lots.

Q. What rent do you pay for those two lots?—A. Fifty dollars a year for one, and $150 a year for the other.

Q. What is the size of the lots?—A. One of them is 150 by 50 feet, and the other 150 by 100, I should guess.

Q. What was your object in paying 6 or 7 cents a foot for hauling stone that when you got them where you wanted them were not worth more than 4 cents per foot – A. The object was to secure it from being stolen, and protect the interests of the Government.

Q. Do you deem it protecting the interests of the Government to rent a lot upon which to deposit stone, and then to pay 7 or 8 cents per foot for hauling upon it stone not worth over 4 cents a foot?—A. The lots were already rented before for the storage of some of the excavation stone; it did not increase the rent of the lot to pile more stone upon it. It was only a question of hauling.

Q. Well, did you consider that you were advancing the interests of the Government in paying 7 cents for hauling stone that when it was hauled was not worth more than 4 cents?—A. I could not know how much was going to be the cost of hauling.

Q. Did you make no estimate regarding the matter beforehand?—A. I then supposed I would be advancing the interests of the Government to do it.

Q. Do you transact your own business without entering into a calculation of the cost?—A. Not generally.

Q. How did it happen, then, that you hauled this stone at such cost?—A. I cannot say how it happened, if it did happen. It is possible there may be some error, somewhere.

Q. You submitted a statement of the cost of supplying granite to the stone-cutters; how were you enabled to make that estimate?—A. By ascertaining as near as I could the cost of tools and drilling, loading and unloading, hauling, &c.

Q. Did you inquire the cost of quarrying?—A. I do not think I did.

Q. Why not?—A. I do not think there was anybody about there that knew anything about the cost.

Q. In your calculations did you make any estimate of the value of the stone in the quarry?—A. I think I did. In my estimate I think I included everything.

By Mr. GRISWOLD:

Q. By whom are you employed?—A. By the Government.

Q. At what salary?—A. Six dollars a day; that is all there is of it.

TREASURY DEPARTMENT,
Office of Supervising Architect, December 19, 1867.

SIR: I have the honor to submit for your approval plans of the custom-house, court-house, and post office building at St. Paul, Minnesota, with estimates of the cost prepared by the Assistant Supervising Architect and official computor of this office, B. Oertly, esq., and to say that I believe the prices named therein are fair.

It will, however, be seen that no allowance has been made for contingencies, and, as the price of some of the work is estimated, I am of the opinion that it would be injudicious to estimate the cost of the building completed at less than $200,000, which is as low as buildings of the same class in other localities will cost, and which sum I consider ample.

I have selected the Norman style of architecture on account of its fitness for rubble

masonry, of which it is proposed to construct the wall of the St. Paul limestone, being admirably adapted for that character of work. It is proposed to make the dressings of the granite recently discovered in the vicinity of St. Paul.

I have endeavored to design a building that will be found ample for the purposes for which it is intended, and one that will be an ornament to the city and a credit to the Government; at the same time I have endeavored to avoid the unnecessary expenditure of a single dollar.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

Hon. HUGH MCCULLOCH,
Secretary of the Treasury.

Estimate of the cost of the new United States custom-house, court-house, and post office at St. Paul, Minnesota, according to the plans prepared by A. B. Mullett, Supervising Architect.

Rubble masonry	$26,732
Granite-work	37,474
Fire-proof floors	27,810
Brick-work	13,588
Iron-work, including roof-frame	17,031
Slatings and copper roofing	7,611
Marble tilings and marble mantels	8,613
Carpentry and painting, exclusive of floors	12,303
Plastering	9,593
Plumbing and gas fixtures	3,100
Heating apparatus	9,480
Total	173,335

TREASURY DEPARTMENT, *February* 25, 1868.

SIR: Yours of the 18th instant is received. In reply, I have to say that the new custom-house at St. Paul will be constructed of the Minnesota limestone, with dressings of granite, for which a large quantity of stone will be required.

Advertisements requesting proposals for furnishing the same will be duly published by the superintendent, and I shall be much pleased to have you submit a bid.

If you are the lowest bidder, and the security and sample of stone are satisfactory, the contract will be awarded to you.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

T. M. NEWSON, Esq.,
St. Paul, Minnesota.

TREASURY DEPARTMENT, *April* 9, 1868.

SIR: I have been called on by H. L. Carver, esq., in regard to the granite for the custom house building under your charge, and have also considered the proposals submitted by you on the 20th December last. I have decided to instruct you to contract for all the granite required, at a cost not to exceed sixty-five (65) cents per cubic foot, the stone to be delivered as rapidly as you may need, and of the dimensions required by the plans, and according to the schedule to be furnished by you.

You will ascertain on what terms you can procure the stone, and award the contract to the lowest bidder, provided he can deliver the stone as rapidly as it will be needed, and of the best quality. You will, however, in awarding the contract, pay more regard to the quality of the stone, and the facilities on the part of the contractor to furnish it without delay, than to any slight difference in the cost, though I desire that you should get the material at the lowest price.

Should you be able to make satisfactory arrangements please order the stone at once, commencing at the base of the building, and prepare contracts and forward for approval in accordance with your instructions.

Very respectfully,

A. B. MULLETT.
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

ST. PAUL, MINNESOTA, *April* 13, 1868.

SIR: In accordance with orders given me by the Supervising Architect, I beg to instruct you to commence work on the building under your charge at once.

You will locate the building on the lot so that the second step shall come on the line of Fifth and Wabashaw streets. The grade will be as shown on drawing No. 14, viz., 3 feet 6 inches to the entrance-floor line above the lowest corner of the lot, and the foundation will be leveled to the depth shown on the same drawing.

The basement walls will be of the dimensions shown on the plans, and will be of rubble masonry. The stones will be laid on their natural beds; there will be at least one quarter of the stones going entirely the walls to the length of, say 3 feet, and not less than 5 inches thick.

The interstices will be well filled with mortar and spawls, and thoroughly grouted. All walls will be pointed in a neat and workmanlike manner. The entire work will be laid up in cement mortar composed of proportions approved after due tests and trials.

You will at once write to Louisville, Kentucky, and ascertain at what rate you can have cement delivered at St. Paul, stating explicitly the price per barrel on the levee here, and specifically agreeing that each barrel shall weigh not less than 300 pounds. On receiving the proposals you will then order by telegraph from the lowest bidder enough cement to construct the basement story.

You will at once enter into negotiations with the granite dealers and report their proposals to the Supervising Architect. The work will be expected to be pushed on with the utmost energy and rapidity, and the utmost economy will be observed in all parts of it.

Very respectfully,

J. C. RANKIN,
Assistant Supervising Architect, Treasury Department.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

[Telegram.]

TREASURY DEPARTMENT, *April* 24, 1868.

A. F. KNIGHT,
Superintendent United States Custom-house, St. Paul, Minnesota:

Have you made arrangements for granite? Time of utmost importance.

A. B. MULLETT,
Supervising Architect.

TREASURY DEPARTMENT, *April* 24, 1868.

SIR: For the last week I have been daily and anxiously expecting to hear from you regarding the granite for dressings of the building under your charge. If unnecessary delay is made now in dressing the stock the entire work will be retarded I have therefore to request that you will at once communicate the result of your action, and also inform me what course you would advise in regard to the granite cutting? Can you get granite-cutters? What do you think would be a fair price for first-rate stone-cutters in your town?

You will insist on the contractors for granite commencing to deliver it *at once*, as I cannot be delayed on that account; and if they do not furnish it rapidly enough I shall abandon the use of that material, and if necessary change the design. I want the building got ready for the roof this season. No provision will at present be made for a cistern in the building.

You will at once make out schedules of the amount of brick, sand, lime, and lumber required to complete the building, and forward the same, together with suggestions regarding your proposed plan of procedure in the conduct of the work. You will use lime mortar for all work above the basement. I cannot too strongly impress upon you the necessity of exerting every energy to press the work forward, and especially to prevent delays in the supply of materials.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *May* 2, 1868.

SIR: Yours of the 27th ultimo is received. In reply I have to say that I am much please to learn you have made arrangements for a supply of granite.

As regards the stonecutters, we are planning to send you six or eight first-class hands, and will get them started at the earliest possible moment. Meantime you will use every effort to get your preliminary arrangements perfected that all possible delay may be avoided.

Very respectfully,

B. OERTLY,
Acting Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *May* 8, 1868.

SIR: Yours of the 1st instant, transmitting for approval your contract with Mr. F. R. Delano for granite, is received. Your contract, although substantially correct, does not in some respects conform to the form of contract in use by this office. I have therefore had prepared and herewith transmit a proposed contract in triplicate, with Mr. Delano, which you will please have executed, taking care that the blanks in the bond and body of the contract as to date of bids, &c., be properly filled up, and return the same to this office for approval as soon as practicable.

I shall have a revised form of contract from the printer in a few days, when I will send a few copies for the use of your office. Meantime let Mr. Delano go on delivering stone.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *May* 12, 1868.

SIR: I telegraphed you on the 7th instant that a lot of granite-cutters would leave on that day, but at the last minute the best granite-cutters would not go, and I could have sent you only a lot of inferior workmen and marble cutters, who could not do a good day's work in granite. I have therefore decided to advertise for the labor of cutting, the Department furnishing the stock and the sheds for the workmen.

I wish you to have the inclosed advertisement inserted for one week in the St. Paul Press and Pioneer, and forward the proposals received without delay. I will also advertise for proposals here, and hope between us we may get some bid that is favorable from a reliable person.

I send you to-day all the detail drawings for the granite-work, including a full-size section of the window arches, and have to say that the full-size drawings will be followed without regard to the scale drawings, some modification having been found necessary in the preparation of the full-size section. I also send you by express a standard sample block of granite, showing the style and quality of the granite-work required, which will, I trust, reach you safely.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *May* 13, 1868.

SIR: Inclosed herewith please find copy of advertisement for the labor of cutting the granite for the United States custom-house at St. Paul, Minnesota, and I would very much like to have a bid from you for the work. The granite will be furnished at our own sheds at the site of the building. The rates at which we have purchased it are much lower, I believe, than you would care to furnish it at, even if you could have obtained it at all.

As regards the requirement to have the whole work completed by the 1st of May, 1869, I have to say that I want it all at the very earliest moment, and will accept it as fast as it can be set, or faster, if you desire.

Please send me the bid at once, as an early decision is very necessary. The plans can be seen here or at St. Paul.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

N. OSBORN, Esq., *Joliet, Illinois.*

TREASURY DEPARTMENT, *May* 28, 1868.

SIR: I have to inform you that contract for cutting the stone work of the building under your charge has been awarded to John Stewart & Co., of this city, they being the lowest bidders under the advertisement, and their bid being considered satisfactory. The Government is to furnish the granite, sheds, tools, blacksmith shop, &c., the contract being for the labor of cutting only, including the sharpening of the tools. The necessary patterns will be made by you.

The contracts will be executed here, and the contractors will start at once for St. Paul, with their force of cutters. You will therefore please make every arrangement for them to commence work immediately upon their arrival. They are all working men with small capital, and I trust, therefore, you will use every effort to prevent any delay in their beginning work, as loss of time will be serious to them.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *June* 2, 1868.

SIR: This will be handed you by Mr. John Stewart, contractor for the granite cutting of the building under your charge, who is accompanied by his two partners, Messrs. J. Young and Matthias Breen. I desire you to give them every facility in your power in performing their contract, and to take special care that the granite is delivered promptly at the sheds, that no delay may occur to them. They are all working men. Mr. Stewart has been employed for years as foreman by the contractors for granite work of the Treasury extension, and his partners have worked for them for some time. I know them all to be first-class workmen and industrious men. You will provide them with tools, sheds, blacksmith shop, and will make such patterns as they may require.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent United States Court-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *June* 5, 1868.

SIR: Yours of the 29th ultimo, inclosing proposals for brick, is received. In reply I have to say that nothing but the best quality of hard-burned brick from the heart of the kiln will answer. No brick that are tender or not thoroughly burned will suit.

If the quality of brick offered by Lucius Howe is satisfactory, or if he will agree to furnish a satisfactory quality, and give good security for the fulfillment of the contract, you will award it to him, and prepare contracts and forward them for the approval of the Secretary without delay.

If the quality of brick that Mr. Howe will furnish is not satisfactory, or if he cannot furnish security in the sum of, say $5,000, to one of the next lowest bidders who offers the best brick, provided the quality offered is at least equal to the requirements of this letter and the advertisement.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *June* 25, 1868.

SIR: I herewith return your contract with E. S. Litchfield in triplicate, forwarded by you under date of 16th instant, and have to request that you will have a 25-cent internal revenue stamp affixed to each bond, and return the contract to this office for approval. You will notify Mr. Lucius Howe that it will be useless for him to submit proposals hereafter to furnish materials for use of this Department, for the reason that having violated his engagement to furnish the bricks, no further proposal of his will, under any circumstances, be considered.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *June* 27, 1868.

SIR: Yours of the 22d instant is received. I fully appreciate the difficulties under which you have been laboring in obtaining good masons, and trust your next monthly report will show a material reduction in the cost of masonry.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent United States Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *August* 18, 1868.

GENTLEMEN: Yours of the 20th ultimo, asking an increase from your contract price for cutting stone for St. Paul custom-house, owing to the passage by Congress of the eight-hour law, came duly to hand. In reply I beg to inclose copy of decision of Comptroller in the matter, and to say that you will see by it that none but laborers, workmen, and mechanics, *directly employed* by Government, come under the provisions of the act, and that no officer of the Government is authorized to enlarge the contract price agreed upon when the contract was made.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

Messrs. JOHN STEWART & CO.,
Contractors, St. Paul, Minnesota.

TREASURY DEPARTMENT, *September* 14, 1868.

SIR: Yours of the 5th instant is received. In reply I have to say that I do not understand the difficulties you labor under. The contract of John Stewart & Co. was to cut the whole of the granite work on the building for the sum of $66,955 58, a schedule of prices being agreed on for the convenience of the superintendent in making payment, and also for the purpose of effecting settlement in case of the failure of appropriations and the consequent closing of the work, but the whole of the granite work shown on plans is to be done for the above sum, as proposed in their bid, which is referred to and is a part of the contract, though the price was not embodied in it, the law prohibiting specific contracts for a greater amount than the appropriation.

You will therefore make out their vouchers according to the schedule attached to the contract, paying for piece-work by the piece, measuring superficial work superficially, and lineal work lineally. I inclose a copy of their proposal, and have to say that you will allow them the full amount estimated for by them for each item when completed, even though the measurement should prove too great. In other words, they are entitled to the sum of $66,955 58 for cutting all the granite work required by the plans.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent United States Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *October* 19, 1868.

SIR: Your report of operations for the month of September is received. I have again to call your attention to the very great cost of quarrying stone. According to it 1,205 yards has been quarried, at an average cost of over $7 50 per yard. The total amount paid for same is $9,311 50.

In view, therefore, of the enormous amount of money expended on this item, and there not being any satisfactory diminution in the cost of quarrying, I have to request that you will give me such information as will enable me to determine whether it would be advisable to purchase the stone in market or not.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent United States Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *December* 8, 1868.

SIR: Yours of the 2d instant is received, and I have much pleasure in informing you that for the first time a satisfactory explanation of your quarrying operations has been made.

The cost of the stock, (21½ cents,) as exhibited by your letter, is entirely satisfactory. Had your reports been made explicit as to the various items of expenditure and their application on the work, I should have had no difficulty in arriving at the exact state of the case as now explained. I have much pleasure in commending your management of that particular branch of the work.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent United States Custom-house, St. Paul, Minnesota.

ST. PAUL, MINNESOTA, *December* 14, 1868.

FRIEND MULLETT: The granite company, through Mr. Wilder, its president, have made an offer to cut the balance of the granite for the post office and custom-house; they have made an offer which I am well satisfied is as low as it can be done, when you take into consideration the hardness of the rock and the peculiar workings of the eight-hour law. You are well aware that our company are, and have been, anxious to get the granite in good shape into this fine building that you are erecting at St. Paul. *Not* that we expect to make, (but, on the contrary, will lose many thousands of dollars,) but as an advertisement for our granite. Stewart & Co. have been encouraged and assisted each month by our company, and we have paid their losses. They would have thrown up the contract months ago had not we stood by them, hoping that the next month something would turn up that would enable them to make wages. I am afraid it will cost you much more, at least 20 per cent., to cut it by the days' work. We want to bring the cutting at as low a rate as we can, so as to know exactly what can be done in the future.

If it is not possible for you to *award* the *contract* to us *without* advertising our bid, (that is, if Mr. Wilder may be considered as a bid when you advertise,) there is not any money in the contract at our figures, Mr. Stewart says. I hope, whatever action you take, that you will remember that Stewart & Co. are as hard-working and faithful men as ever I saw, and that they have tried faithfully to complete their contract, and no better men than they could be found.

Our company, and more especially your obedient, are under many obligations to you for the handsome notice you gave of our stone in your report, and I trust that the time is not far distant when some of us will be able to reciprocate.

Have you that model treasurer's room complete?

Very truly, your friend,

H. L. CARVER.

TREASURY DEPARTMENT, *December* 26, 1868.

DEAR SIR: Yours of the 14th instant, in regard to the contract for granite-work of the St. Paul custom-house, is received. In reply, I have to say that I do not well see at present how anything can be done in regard to the matter. As I have no doubt that you will, in accordance with your usual custom, visit Washington before long, I will explain the case to you fully upon your arrival.

Truly, yours,

A. B. MULLETT,
Supervising Architect.

N. L. CARVER, Esq., *St. Paul, Minnesota.*

TREASURY DEPARTMENT, *January* 18, 1869.

SIR: I have to request you to advise me, at the earliest possible moment, the rates of wages paid in each branch of mechanics, and for laborers in your vicinity, in the spring of 1861, or at the opening of the war. Your early attention to this is requested.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent United States Custom-house,
St. Paul, Minnesota.

TREASURY DEPARTMENT, *January* 18, 1869.

SIR: In reply to your letter of the 6th instant, relating to the *per diem* pay of Messrs. John Stewart, John T. Young, and Matthias Breen, I have to say that the wages allowed them by you ($5 25 per day) appears to me to be high and more than the market rates. Previous to their leaving Washington they were paid by the contractor for granite-work as follows, viz.: Stewart, $4 37; Young and Breen, $4 each, per day. I consider $4 per day to be proper wages for them, inasmuch as the *majority* of your other stonecutters receive only $4, and the best of them but $4 25. I must, however, leave the matter more or less to your discretion; but cannot consent that their *per diem* should, under any circumstances, exceed $5.

With reference to their contract I have to say that I have been formally notified by them that they were compelled to abandon it, and that they have so done is evident from the fact that they are now employed by you by the day. They need not indulge in the hope of any *further consideration or allowance* on account of their contract from me; they must either carry out its provisions to the letter or abandon it *in toto*. The most I feel at liberty to do in the matter is to recommend to the Secretary to cancel their contract entirely and pay them *per diem* wages from the commencement of their operations there, together with cost of their railroad fare, &c. This I am willing under the circumstances to do.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *February* 9, 1869.

SIR: Yours of the 2d instant is received, inclosing sketch and showing proposed character of work to be done on the limestone facing of walls of the building under your charge. While admiring the handsome appearance that such work would make, I must call your attention to the fact that the cost of it is entirely too great to be attempted under our appropriation. As reported for the month of January, the cost would be 74 cents per superficial foot, somewhat in excess of your own estimate, and very much more expensive work than is contemplated by the specifications.

As you are fully informed regarding the size and capability of the material at your disposal, I will not attempt to advise you particularly what method to employ to lessen the expense of this work; but would ask you to give it your best consideration and submit another sketch giving me the result of your investigations. I would suggest, however, that a fertile cause of the great cost of dressing this rubble lies in the fact that so many of the stones are of small size. By adhering more closely to the specifications you may attain the required result within proper limits of cost. Please give the matter your immediate attention and inform me as to the result, keeping in view the fact that the execution of all work done in the building must in no wise exceed your estimate, but, if at all possible, come considerably within its limits.

Very respectfully,

A B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *February* 23, 1869.

SIR: I am in receipt of yours of the 7th instant, relative to the cost of cutting limestone and granite and quantity of sand hauled. Your explanation regarding the limestone is perfectly satisfactory, and I trust you will be enabled to keep its cost within your estimate. I find the contract price for cutting water-table to be 95 cents, and quoins $1 55. Your cutting on those articles for the month of January amounts to $2 76 per foot, a sum so largely in excess of Stewart & Co.'s contract price that the cost of the building will greatly exceed the estimate if the cutting cannot be done at a smaller price. You will please give this matter your attention and see what can be done to bring the cutting to the estimated price.

I do not understand how the sand comes to cost $1 58 per yard, the only expense being hauling. Under ordinary circumstances a yard ought to be hauled at a load and the driver do his own loading and unloading. Five yards per day would not be very heavy work, if the distance was, say, two miles from the building, and allowing $8 per day for team and driver would bring the sand to $1 50 per yard, the price usually paid by this office for similar work.

Please devise some means to reduce the cost of granite cutting, and explain why the sand is costing so much.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT,
Office of Supervising Architect March 11, 1869.

DEAR SIR: I have received a copy of the St. Paul Dispatch of February 27, with a severe article on the management of the custom-house under your charge. I, of course, understand that it is published in a "copperhead" paper, and that you have enemies enough. I do not therefore attach any importance to it of itself. Still, as you know, the progress of the work has not, up to this time, been at all what I expected; and as the appropriation bills have now passed, and as we have but an aggregate amount of $75,000 in the deficiency and the regular bill, I desire you to make a careful estimate and advise me to what point you can carry the building with that amount of money. You will please forward this estimate without delay.

You will also please obtain proposals for cutting the granite from any responsible parties in your city who may desire to bid, including Mr. Wilder, president of the new granite company, who was here a day or two since and promised to present a proposal. I desire the proposals to be made according to the schedule attached to the contract of Stewart & Co., and would beg you to forward both these proposals and your estimate at the earliest possible moment.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *November* 26, 1869.

SIR: I am in receipt of your favor of the 19th instant, inclosing estimate for putting up the first and second stories of the building under your charge. The prices there named for the granite-work are so outrageously high that I have to request you to procure bids at once for the execution of the work by contract, and forward them to this office as soon as possible. A very considerable saving must be made, or the use of that material will have to be abandoned.

I would call your attention to the estimated cost for setting belt course, which appears to me to be very high; the stones composing it are not difficult to handle, and should not exceed in cost over eighty or ninety cents to set per lineal foot. Your other items I deem reasonable, but I shall expect you to use the very utmost economy in prosecuting the work

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *November* 31, 1869.

SIR: Yours of the 24th instant is received. In reply, I have to say that after a careful examination of the proposals submitted by you I do not feel inclined to recommend the acceptance of any. I think your own estimate of the cost of the work is a liberal price, and certainly cannot recommend the acceptance of a proposal above the rate at which you estimate its cost.

Please see Mr. Wilder and say to him that I should be glad to have him revise his figures and endeavor to approximate more nearly our estimate of the cost of the work. If this cannot be done, or the present prices reduced, I shall recommend the Secretary to suspend operations entirely, and see if some cheaper material cannot be obtained, as there appears no prospect of obtaining an estimate sufficiently low to complete the building with the present material.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent United States Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *April* 1, 1869.

SIR: Yours of the 27th ultimo is received. In reply, I have to say that I will endeavor to procure and send you more granite cutters, as requested by you, and have also to say that you are authorized to place your clerk's name on the pay-roll, as requested.

I am glad to find that you are determined to push matters, and feel encouraged at the tone of your letter, it being considerably less despondent than those heretofore received. You need not fear any efforts that are made to prejudice me against you, if you can only succeed in driving things. I do not care for the opinions of any other parties, and prefer to judge for myself from the results accomplished by the officers under your charge. In this connection, I would say that I think I can send one or two first-class stone-masons or setters that have worked for me on this building for some years, and thoroughly understand granite setting, and are good, industrious workmen.

Please let me know if you have men that suit you, or if you would like some sent you.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *April* 6, 1869.

SIR: Will you please advise me by return of mail to what use you propose to put the stone excavated from the foundations of the custom-house building under your charge? My original intention and expectation was, as you know, that it would be used in the building.

Please advise me if it is available for backing or not, and report fully on the matter.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *April* 12, 1869.

SIR: Yours of the 8th instant, in regard to procuring the limestone for the custom-house building under your charge, is received. In reply, I have to say that you will please advertise for two weeks in the St. Paul Daily Press for the amount of stone necessary to complete the first two stories of the building, and will, when opened, forward the proposals in the manner required by your instructions, with your recommendations as to their acceptance or rejection. In case the lowest bid is not at a fair price and the bidder in every way responsible, you had better recommend the rejection of the bid and the purchase of the limestone in open market. You have, as I understand, sufficient stock on hand to keep you busy for some time, and there is no particular need of haste.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *April* 12, 1869.

SIR: Yours of the 7th instant, advising me that you have on hand about a thousand yards of an inferior quality of limestone, that will not be required in the building, is received. In reply, I have to say that if it is not suitable for use and cannot be used to advantage for backing, which, it appears to me, could be done, you will please advertise for proposals for purchasing the same, which you will open as provided in your instructions and forward to this office, with your recommendations in regard thereto. If no proposals be received at market prices you will then be authorized to dispose of it, on the best terms possible, by private contract.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *April* 15, 1869.

SIR: Your favor of the 9th, covering estimate to complete the granite work of the building under your charge, is received and approved. You will therefore proceed with the cutting as heretofore, using your best energies to keep the cost of the work to the lowest possible figure admissible with good work.

Very respectfully,

A. B MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *April* 16, 1869.

SIR: Yours of the 12th instant is received. In reply, I have to say that I have previously directed you to dispose of the stone piled on the ground rented for that purpose. I have now to say that it appears to me that there can be no stone in your possession that is not suitable for backing. I do not desire to sell a single cubic foot of stone and purchase other to replace it, if the stone sold can be used at all. I have therefore to say that you will not dispose of any stone unless you are confident that it cannot be used and will not be needed in the construction of the custom-house. Please consider my previous letter, authorizing you to obtain proposals, modified by this.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *April* 17, 1869.

SIR: The following persons have been engaged for the work under your charge and will leave here on Monday morning next for St. Paul: Robert Ducket, stone-cutter; James Hawkins, stone-cutter; Thomas Brennan, stone-cutter; Joseph Worth, stone-mason; Martin Kelley, stone-mason; Michael Johnson, stone-mason; James Whalen, stone-mason. Their fare has been paid through, and you will therefore please deduct the cost of tickets, viz., $38 55, from the pay of each, noting the same on the pay-roll as heretofore.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT, *April* 26, 1869.

SIR: Yours of the 21st instant is received. In reply, I have to say that. as soon as you think desirable, you are authorized to sell such stone as will not be needed by you, at public auction, in such quantities and on such conditions as you think will best subserve the interests of the Government, after advertisement in one of your papers every other day for two weeks. You will be careful to dispose of only the refuse stone, and will dispose of nothing that will need to be replaced. Should it not be practicable to sell the stone on reasonable terms and use all good stone in the building. I do not of course desire any contingent expenses that can be dispensed with.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT,
Office of Supervising Architect, June 28, 1869.

SIR: Yours of the 24th instant is received. I confess that its contents, after all that has passed, surprised me, and I feel it my duty to say that unless you can complete the two first

stories of the custom-house building under your charge this season, I shall be compelled, very reluctantly, to recommend a change in the superintendency. You have a contract with the granite company for the supply of stone, which you have the legal power to enforce. I do not propose to delay the work in order to suit the wishes of the contractors.

The contract for granite cutting was approved upon your recommendation and on your assurances that it would facilitate the work, and yet in the first I receive on the subject since the contract was signed, you inform me that the contractors cannot get hands. I really think it was time you had made arrangements to overcome the difficulties and delays in regard to your work.

Very respectfully,

A. B. MULLETT
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent United States Custom house, St. Paul, Minnesota.

TREASURY DEPARTMENT,
Office of Supervising Architect, June 1, 1869.

SIR: I have this day returned from a trip to New England and find your letter of the 26th ultimo, advising me that you had been unable to obtain any proposals for furnishing the limestone facings required to complete two stories of your building under your advertisement, and that Mr. Davidson, the owner of the quarry worked by the Government last year, has made a verbal offer to furnish the stone for 35 cents per cubic foot, delivered at the custom-house site. I find, upon examination of your reports, that the stone cost but 21½ cents per cubic foot when obtained by you. Under these circumstances I do not feel justified in authorizing you to contract with Mr. Davidson for the stone, and would prefer that you should continue to procure the material in the same manner as last summer. You will, therefore, make your arrangements accordingly.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT,
Office of Supervising Architect, June 17, 1869.

SIR: Yours of the 11th instant is received. In reply, I have to say that I am much surprised to find that the limestone facing for your building cost you last season $38\frac{1}{10}$ cents per cubic foot, as it was inferred from your reports and letters that the 21½ cents, as shown on reports, covered the entire cost.

As it appears, however, that this is not the case, and that it will cost more to obtain the small amount required for two stories of the building, if compelled to strip a quarry, than the bid of Mr. W. F. Davidson, viz., 35 cents per cubic foot, delivered at the site, I have to instruct you to purchase of him, at that price, all the limestone required for two stories of the building, and to use every effort to have it delivered and cut at the earliest possible moment. Please push matters to the utmost, as the season is rapidly passing, and no time should be lost.

Very respectfully,

J. C. RANKIN,
Acting Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT,
Office of Supervising Architect, August 2, 1869.

SIR: Your letter of the 29th instant, explaining excess of cost of work over your estimate is duly received.

The explanation now made should have been included in your letter of advice attached to your June report, trouble would thereby have been saved yourself and the Department.

I note what you say in regard to the delay and the cost incurred through want of prompt delivery of the granite. I cannot refrain from expressing my astonishment that you should assign such a reason as an excuse for excessive cost of work done under your supervision,

seeing that the conditions of the contract give you full power to take such action as you deem fit to compel a sufficient supply of material. And among your duties as superintendent one of the first is to see that the interests of the Government are protected, and no loss sustained through failure of contractors to furnish materials promptly, or employés to use them with celerity when obtained.

I have to instruct you to ascertain the exact amount of damage which has been sustained by the Department, through the failure of the contractor to furnish granite in sufficient quantities and at times to prevent delay or loss in the construction of the building, and charge the full amount of the same against him, deducting it from the drawback percentage, or from the last payment in addition, if the drawback is not sufficient to cover the entire sum lost to the Department through his negligence.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent United States Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT,
Office of Supervising Architect, September 30, 1869.

SIR: In reply to yours of the 25th instant, containing some explanation as to the excessive cost of the brick work, it is still considered by this office that the cost was extravagant; and your idea that the time of the master mechanic and other items mentioned should be deducted, a most erroneous one.

The net quantity of work (1,333 feet) you report as being made by the 30,000 bricks is surely a mistake. The Department will thank you to forward the size of brick now being used by you.

Very respectfully,

J. C. RANKIN,
Acting Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house, St. Paul, Minnesota.

TREASURY DEPARTMENT,
Office of Supervising Architect, October 16, 1869.

SIR: Yours of the 11th instant has been received. Your estimate of the number of bricks (of size quoted by you) to the cubic foot is certainly too high; 21 would require an excessively fine point, and it is not understood how more per cubic foot can be used. Your attention is drawn to this in order that in the future no discrepancy may arise between the number of bricks in walls as reported by you, and the number paid for and borne on the returns.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent United States Custom-house, St. Paul, Minnesota.

ST. PAUL, MINNESOTA, *December* 13, 1867.

SIR: Yours of the 5th instant is just received. In answer, I have to say the report for the month of November was duly forwarded on the 6th instant.

In regard to the cost of granite, from the best information I can get, after careful inquiry, I estimate the cost delivered in St. Paul at building site, as follows:

	Per foot.
Dimension granite at quarry, estimated at	$0 50
Transportation by rail 70 miles, estimated at	15
Transportation from depot to building	03
Total cost per cubic foot	68

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq.,
Supervising Architect, Washington, D. C.

ST. PAUL, MINNESOTA, *December* 20, 1867.

SIR: I have at last succeeded in getting two proposals for furnishing granite for the St. Paul custom-house, which I herewith inclose. Not knowing the dimensions or quality required, I was unable to give the bidders the information necessary to enable them to make as close a bid as they otherwise might have done. These will, I trust, enable you to decide as to its adoption. Should you require more accurate bids please send me the approximate sizes and quantity.

Messrs. Morris and Delano are thoroughly competent and reliable men, and will fulfill any engagement which they may make. I will add, in this connection, that they are owners of different quarries.

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq.,
Supervising Architect, Washington, D. C.

ST. PAUL, *April* 27, 1868.

SIR: I have awarded the granite contract to F. R. Delano, esq., of this place, at 65 cents per cubic foot, delivered at custom-house site. He has already commenced quarrying and will deliver enough to start the stone-cutters by the 8th of May. I have also contracted for 300 barrels of fresh-ground cement, at $3 15 per barrel, delivered on the levee here. I expect it to arrive in time to commence the masonry by May 5. I will forward granite contract for your approval as soon as I can complete schedule.

If you can send me eight or ten good granite cutters I shall be obliged, as not more than five or six can be had here. Should more be needed they can be secured as occasion requires. My desire is to commence the work right, and am arranging all things to that end. It necessarily takes more time to organize than when accomplished workmen are at hand.

I will send to-morrow plans and estimates of derricks, tool house, office, shops, &c.

Very respectfully, &c.,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department, Washington, D. C.

JOLIET, ILLINOIS, *May* 18, 1868.

SIR: I have to acknowledge the receipt of your letter of the 13th instant, covering advertisement for the granite cutting for the custom-house St. Paul, Minnesota, and in reply would state that it will be impossible for me to give you a proposal for the work. Stone-work in the West is completely overrun this season. I went to Chicago on Friday last to get some cutters; offered them $5 per day, but could get none at that. I also tried to contract for the ashler for the Des Moines work, but the yards there have all they can do at present. I have given Colonel Shipman a bid for the stone-cutting of the Madison court-house, and if it is awarded to me shall put up machinery here. Thanking you for sending me the advertisement,

I am yours, respectfully,

C. C. MOODY
Per N. OSBURN.

A. B. MULLETT, Esq.,
Supervising Architect, &c.

ST. PAUL, MINNESOTA, *May* 25, 1868.

SIR: Your telegram of the 23d instant was not received until to-day. Granite cutting here is a new business, and I doubt if an intelligent bid can be got, though parties are beginning and favorable propositions may yet be had. All the preparations are complete and ready for the cutters, so there need be no delay after parties are found to undertake it.

I have received proposals for furnishing brick, prices ranging from $10 85 to $14 75, which I will forward as soon as I can examine the brick, which will be in a day or two.

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department.

ST. PAUL, MINNESOTA, *June* 2, 1868.

SIR: Yours of the 28th ultimo, informing me of the letting of the granite cutting to Messrs. John Stewart & Co., is this day received.

No bids have been received here, the parties referred to in my letter of the 25th ultimo having concluded not to submit proposals.

The sheds, shops, &c., are built, and all will be in readiness for the cutters upon their arrival.

Very respectfully,

A F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT,
Supervising Architect Treasury Department.

ST. PAUL, MINNESOTA, *June* 15, 1868.

SIR: Yours of the 9th instant is received; also full-size working drawings for the granite. The granite which has been delivered at the sheds is so very hard that Messrs. Stewart & Co. have concluded that it cannot be advantageously worked, and in consequence Mr. Delano is opening another quarry, which promises to work more easily and is much handsomer, it being of a reddish shade.

A specimen has already been dressed and finishes equal to that sent here by you. This change of quarries will occasion some delay to the granite cutters, probably about one week. In the meantime their men can work at limestone.

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT,
Supervising Architect Treasury Department.

ST. PAUL, *July* 14, 1868.

SIR: Yours of the 8th instant is received, and accordingly the mechanics, laborers, and workmen are working only eight hours per day. I presume the intention is that the wages shall remain the same as when ten hours constituted a day's work, but have left that question in abeyance until further advices from you. I will, however, add that the workmen now employed will not submit to any reduction of pay.

Very respectfully, &c.,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq..
Supervising Architect Treasury Department, Washington, D. C.

ST. PAUL, MINNESOTA, *October* 26, 1868.

SIR: Yours of the 19th instant, relating to the cost of quarrying stone, is received. In reply, I have to say that the apparent high cost of quarrying stone is owing to the large proportion of stripping, 8 feet; 6½ feet of solid, but worthless, rock, and 1½ feet of earth, which had to be removed, and which has been counted in the cost of the stone already reported. All the stripping is now done and the quarry in the best working condition, and it is confidently believed that when the quarry bench is finished, which will probably be next week, that the aggregate cost of stone per yard will not be more than the cost of similar work reported last year.

I think the rock cannot be procured on contract for less than 30 cents per cubic foot.

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department.

ST. PAUL, MINNESOTA, *December* 2, 1868.

SIR: Yours of the 23d ultimo, in relation to remittal of funds and suspension of work, was duly received and contents noted. In regard to quarrying stone I submit the following report:

Cost of stripping quarry	$2,493 81	
Cost of hauling stripping from quarry	1,185 95	
		$3,679 76
Cost of quarrying stone, 792⅓ yards	2 327 67	
Cost of hauling same from quarry to site	1 482 44	
Cost of stone in bed	789 60	
		4,599 71
Total cost, including stripping		8,279 47

Cost of quarrying stone, per cubic foot	$0.1088
Cost of hauling stone, per cubic foot	0.0692
Cost of stone, per cubic foot	0.0369
Total cost, per cubic foot	0.2149

I have examined the subject of quarrying as thoroughly as possible, but owing to not having kept separate accounts of the cost of stripping and cost of hauling away the refuse stuff, am unable to give more than an estimate of the cost of each item of work, based upon what I know has been done some days at a certain cost. In compliance with your instructions, all work except that necessary to protect the foundation walls, and also making and putting in skylights in granite cutters' sheds' has been suspended.

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department.

ST. PAUL, MINNESOTA, *January* 6, 1869.

SIR: The proposition to Messrs. Stewart & Co., to continue the work by the day, has been submitted to them and been accepted, to take effect on abandonment of their contract, December 4, 1868. The wages per day asked by them are higher than we have been paying, but I regard their prices as satisfactory, considering the ability of the men, and would refer you to the pay-roll for December, which will be forwarded in a few days, for the detail of prices.

Messrs. Stewart & Co. desire to leave the old contract open for the present for further consideration, in hopes of securing an allowance to pay them for the unexpected difficulty of working the granite.

Arrangements can be made to prosecute the limestone dressing, the workmen to receive pay whenever appropriation shall be made for the same. Work will be commenced at once.

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department.

ST. PAUL, MINNESOTA, *January* 25, 1869.

SIR: Yours of the 18th instant in relation to the rates of wages for mechanics and laborers in the spring of 1861, in this vicinity, was duly received.

In reply, I have to say the prices paid *per diem* were as follows: Carpenters, $1 25 to $1 50; masons, $1 50 to $1 75; plasterers, $1 50 to $1 75; laborers, $0 75 to $1; stonecutters, $1 75 to $2.

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department.

ST. PAUL, MINNESOTA, *February* 2, 1869.

SIR: Inclosed find sketch of limestone face for custom-house at this place. I expect to reduce the cost of dressing limestone this month about 20 per cent. for face-work, as only the larger stones are now being dressed, the smaller stones to be fitted by the masons on the scaffold. The stones are being dressed to about a $\frac{5}{8}$-inch joint, and pitched to a line. By dressing limestone this winter, the work is being better done than could be by masons on the scaffold, and will greatly tend to forward the progress of the building the coming season.

The sketch is sent for the purpose of giving an idea of the character of work being done, and also to enable you to make any suggestions deemed advisable. Is has been found necessary to employ some competent person to take charge of the limestone dressing and preparing stone for the cutters; I have, therefore, deemed it advisable to engage Mr. Milner, at $4 per day.

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department.

ST. PAUL, MINNESOTA, *March* 2, 1869.

SIR: Yours of the 23d ultimo was duly received. In the item of expense for sand the cost has been increased by the difficulty of procuring suitable material; the water rising froze the surface of our bank, which had to be picked off, thereby requiring more labor than would otherwise have been the case; and a part of the time the roads were bad, so that a full load could not be hauled, and I feared to suspend the work, as the water might continue to rise and prevent our getting the sand. We are now getting a finer quality of sand for the granite setting, at a different locality, which is costing about $1 per yard.

In regard to the cost of granite cutting, the necessity of doing more work has been repeatedly urged, without producing satisfactory results so far. The men seem to work faithfully, but the material is very hard to work, so that not much can be turned out per day. The men are not doing as much now as under the contract with Stewart & Co., and it will be difficult to get as much work out of this set of men, or, in fact, any set of men, by the day as by contract. I am satisfied the cutting cannot be done for the contract price. The water table, and some other portions of the work, cost about double the schedule price while worked by contract.

I know of no plan by which the granite can be cut for the contract price.

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department.

ST. PAUL, MINNESOTA, *March* 17, 1869.

SIR: Yours of the 11th instant was duly received. In relation to the article in the St. Paul Dispatch of the 27th ultimo, I have only to say that I am accountable to the Supervising Architect and Treasury Department for my bad management, or other offenses which I may have or may commit, and not to the Dispatch or to any persons who may regard it as their especial province to meddle with matters which they do not understand, and of which they have no right to speak.

I must admit that the progress of the work last season was anything but satisfactoryto me; most of the difficulties which embarrassed and retarded the work then have been surmounted and will not have to be dealt with this season.

One thing is certain, I will show a proper amount of work for the money expended, or leave the position for one who may do better. I will complete and forward without delay the required estimate, showing how far the appropriation of $75,000 will carry the work. I will also send the proposals for granite cutting as soon as they can be obtained.

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department.

ST. PAUL, MINNESOTA, *March* 24, 1869.

SIR: I herewith inclose for your consideration the proposals received for the completion of the granite cutting for the building under my charge. The bidders are all men of wealth.

Mr. Wilder possesses facilities superior to any one here for doing the work, and as his is the lowest bid I would recommend that it receive your favorable consideration. I do not think the work can be pushed as rapidly as he proposes, and as fast as it will be required, for less wages than $5 a day per man, and estimating upon that basis do not consider his proposal too high. I inclose a letter from Mr. Wilder which shows fully what he proposes to do in case the contract shall be awarded to him.

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department.

ST. PAUL, MINNESOTA, *March* 31, 1869.

SIR: Yours of the 26th instant, relating to my estimate of the cost of putting up the first and second stories, and also to the apparent high cost of setting belt course and cutting granite, is received. In reply, I have to say that the belt course may not cost as much as it was estimated. The cost of setting includes the cost of moving it from the cutters' shed to the building.

The proposals for granite-cutting already forwarded, as you will see, are still higher than my estimate. If desired, I will attempt to get a more favorable proposition, or, if thought best, endeavor to economize some by working it by the piece, day, or in any manner which, in your judgment, you may deem best.

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department.

ST. PAUL, MINNESOTA, *April* 5, 1869.

SIR: Yours of the 31st ultimo is received. I have seen Mr. Wilder to-day, and he has promised to revise his proposal, and if practicable, reduce it so that it may be acceptable to you. My estimate of the third story is far enough advanced to show that it can be done for considerable less than Mr. Wilder proposed.

It is based upon the same data as first and second stories, and will enable you the better to judge of the correctness of Mr. Wilder's proposal.

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department.

ST. PAUL, MINNESOTA, *April* 7, 1869.

SIR: I have on hand about 1,000 yards of rock of inferior quality, and not required in the building, stored on rented ground, costing $150 per annum. At this season of the year, there is a demand for such material. I would, therefore, recommend that you authorize its sale and removal, so that the ground may be used to better advantage, or the rent of the same saved to the Government.

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department.

ST. PAUL, MINNESOTA, *April* 8, 1869.

SIR: In your letter of October 19, 1868, you inquired whether the limestone required to complete the custom-house could not be procured in the market or by contract cheaper than by working a quarry. From inquiries made since then I am satisfied that it can be. The working of the quarry last year was not satisfactory, the cost being considerably more than

I had estimated or expected. Some more first quality dimension stone (about 1,000 cubic feet) will be required to complete two stories. From past experience I cannot expect to work the quarry to better advantage this year than last, and I would therefore recommend that proposals for the deficiency be received for its supply by the cubic foot; or that it be purchased in open market. The latter I think the preferable way.

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department.

ST. PAUL, MINNESOTA, *June* 24, 1869.

SIR: Yours of the 17th instant, in relation to the purchase of limestone required for the completion of first and second stories of United States custom-house here, is received, and in accordance with the instructions therein, the agreement with W. F. Davidson has been concluded, and he is now engaged in quarrying and delivering the stone.

I have so far been unable to procure granite as fast as required or expected, and have in consequence been compelled to reduce the force of workmen. A change has been made in the management of the quarry, which it is believed will supply the rough granite as fast as required. Nothing then will be lacking but a complete force of granite-cutters, which the contractor assures me he is endeavoring to procure, but his efforts so far have been rewarded with but little success.

If the granite drawback can be overcome there is still abundant time to complete the two stories.

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department.

ST. PAUL, *December* 19, 1867.

SIR: Understanding that you may require some granite stone in the construction of the St. Paul custom-house, I have the honor to submit the following proposal for first-class material, delivered on the site of building, Wabashaw street, St. Paul: For all stone, 1 by 2, 1 by 3, 1 by 4, 2 by 2, of lengths from 4 to 10 feet, at the rate of, per cubic foot, 56 cents. I am now taking out stone from my quarry for the St. Cloud bridge.

Respectfully, your obedient servant,

CHAS. A. F. MORRIS.

A. F. KNIGHT, Esq.,
Architect St. Paul Custom-house.

ST. PAUL, *December* 20, 1867.

SIR: In reply to your request for a bid to furnish granite for the St. Paul custom-house, I have to say that I will furnish dimension granite, delivered at the custom-house, for and at a price ranging from 35 to 100 cents per cubic foot, according to the size and shape of the blocks required. Without a bill of the sizes I cannot give you an exact figure, but from my knowledge of the work should think that about 65 cents per cubic foot would be the price for all required. Will give you the exact figure if you will furnish me an exact bill of the dimensions and how they are to dress.

Yours, respectfully,

F. R. DELANO.

A. F. KNIGHT, Esq., *St. Paul.*

ST. PAUL, MINNESOTA, *February* 18, 1868.

SIR: For four years I acted as commissary and quartermaster in the United States Army. Have a clean release from all my accounts, and my bondsmen have been released. Have been fifteen years in this country. So much for introduction.

My purpose in writing you is to give you the information that I am the owner of 123 acres of solid granite, at a town called Watab, on the Upper Mississippi. This granite is pronounced to be very excellent and is the only great upheaval in the Mississippi Valley. David Dale Owen, in his official report, says, page 168: "Near the road and about two

miles from the Osakis (Sauk) Rapids, there rises out of the prairie a dome-shaped mass of syenitic granite, elevated 10 to 12 feet above the level of the plain. It is worthy of notice here, as being the first rock found *in situ* on the land route from the Falls of St. Anthony to Crow Wing."

On page 166 he says: "Seven or eight miles above Osakis (Sauk) Rapids is a high exposure of crystalline rocks. A ridge of hornblende and syenitic greenstone, with veins of granite bearing north 70° to 80° east, rises on the east side of the Mississippi to the height of 30 to 40 feet; and a short distance further back even to the height of 60 to 70 feet."

Watab is four miles above Sauk or Osakis Rapids and a mile or two below Little Rock, on the Upper Mississippi. It is here where the rock rises from 60 to 70 feet—granite.

If the custom-house of this city is to be built of granite, I desire an opportunity to put in a bid.

Respectfully yours,

T. M. NEWSON,
Formerly Brevet Major, C. S. United States Army.

Hon. A. B. MULLETT,
Supervising Architect Treasury Department, Washington, D. C.

John Stewart & Co.'s proposal for cutting the granite-work for the custom-house at St. Paul, Minnesota.

I hereby propose to do the granite-cutting required by the plans and specifications for the custom-house at St. Paul, Minnesota, as follows, viz:

No. 4. Hammered work:	
702 superficial feet of underpinning, at $1 46	$1,024 92
350 feet 9 inches, lineal, of underpinning, with wash, at $2 60	911 95
187 feet, lineal, of area coping, at $1 68	314 16
2,160 feet, superficial, of quoins of building, at $1 55	3,348 00
4 117 feet, superficial, of quoins of doors and windows, at $1 55	6,381 35
8 chimney tops of 16 feet girth, 12 feet high, at $350	2,800 00
No. 3. Hammered work:	
200 feet, lineal, of water-table, at 95 cents	190 00
436 feet, lineal, of steps, at $1 80	784 80
160 feet, superficial, of platforms, at 96 cents	153 60
476 feet, superficial, of sills, at $1 28	609 28
12 double windows, second story, at $1,060	12,720 00
12 double windows, third story, at $815	9,760 00
2 triple windows, (narrow,) second story, at $1,200	2,400 00
2 triple windows, (narrow,) third story, at $1,150	2,300 00
2 triple windows, (wide,) second story, at $1,238	2,476 00
2 triple windows, (wide,) third story, at $1,200	2,400 00
4 circular gable windows, at $245	980 00
425 feet 6 inches, lineal, of belt-courses, at $5 90	2,510 45
369 feet 4 inches, lineal, of horizontal cornice, at $27	9,972 00
134 feet, lineal, of raking cornice, at $28	3,752 00
4 turrets, 21 feet girth, 16 feet high, at $495	1,980 00
4 turrets, 13 feet 4 inches girth, 12 feet high, at $365	1,460 00
No. 2. Hammered work:	
2 doors with narrow side-lights, at $1,075	2,150 00
2 doors with wide side-lights, at $1,238	2,476 00
2 double doors, at $1,045	2,090 00
10 double windows, at $1,085	10,850 00
Total	86,794 51

John Stewart & Co.'s prices for stone cutting, as accepted June 2, 1868.

702 superficial feet of underpinning, at $1 46	$1,024 00
350 feet 9 inches, lineal, of underpinning, with wash, at $2 60	911 00
187 feet, lineal, of area coping, at $1 68	314 00
2,160 feet, superficial, of quoins building, at $1 55	3,348 00
4,117 feet, superficial, of quoins doors and windows, at $1 55	6,381 35
8 chimney tops of 16 feet girth, 12 feet high, at $350	2,800 00
200 feet, lineal, of water-table, at 95 cents	190 00

436 feet, lineal, of steps, at $1 80	$784 80
160 feet, superficial of platforms, at 96 cents	153 60
476 feet, superficial, of sills, at $1 28	699 28
12 double windows, second story, at $636	7,632 00
12 double windows, third story, at $489	5,868 00
2 triple windows, narrow, second story, at $720	1,440 00
2 triple windows, third story, at $690	1,380 00
2 wide windows, second story, at $742 80	1,485 60
2 wide windows, third story, at $720	1,440 00
4 circular gable windows, at $245	980 00
425 feet 6 inches, lineal, of belt courses, at $5 90	2,510 45
369 feet 4 inches, lineal, of horizontal cornices, at $27	9,972 00
134 feet, lineal, of raking cornices, at $28	3,752 00
4 turrets, 21 feet girth, 16 feet high, at $495	1,980 00
4 turrets, 13 feet 4 inches girth, 12 feet high, at $365	1,460 00
2 doors with narrow side-lights, at $645	1,290 00
2 doors with wide side-lights, at $742 80	1,485 60
2 double doors, at $627	1,254 00
10 double windows, at $651	6,510 00
Total	66,955 68

ST. PAUL, MINNESOTA, *July* 20, 1868.

DEAR SIR: Your order to Mr. Knight, superintendent, &c., directing him to adopt eight hours as a day's work for employés on the United States custom-house and post office at this place, has compelled us to do the same with our granite cutters, as they refused to work side by side on the same work ten hours per day; there was no alternative except to stop work. Our price for cutting is so low, as you are well aware, that we cannot, without loss, complete our contract, unless we are allowed at least an advance ono ur contract rates, equal to the reduction from ten hours to eight—a day's work (before the issuing of your order) of ten hours being equaled by a day and a quarter, under the new law. We trust you will at once see the justness of our claim, as it places us only in the same position that we were under the ten-hour system, when we took our contract, and before the issuing of your order. We shall be pleased to hear from you at your earliest convenience.

Very respectfully, your obedient servants,

JOHN STEWART & CO.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department, Washington City.

ST. PAUL, MINNESOTA, *November* 4, 1868.

DEAR SIR: We are under the necessity of throwing up our contract for cutting the granite for the St. Paul custom-house and post office. The granite is very much and at least 25 per cent., harder to cut than eastern granite that is used in Government buildings in Washington, or any sample of stone that we have ever seen or cut. The passage of the eight-hour law by Congress since we took the contract has compelled us to pay our granite cutters the same wages for eight hours' work that we did for ten hours' work. Each of our firm has steadily been to work at the bench with the cutters for over five months, and have not been able to make enough to pay wages. We are satisfied, after a long and hard trial, that we cannot complete the contract without a loss of more than we can pay.

Very respectfully, your obedient servants,

JOHN STEWART & CO.

A. B. MULLETT, Esq.

ST. PAUL, *December* 4, 1868.

SIR: I have just been informed that it is the intention of Messrs. John Stewart & Co. to abandon their contract made with you for the cutting of granite for the St. Paul custom-house and post office. If they have abandoned their contract, I will propose to cut the balance of the granite required for the buildings at the prices named in the schedule inclosed provided my proposition is accepted immediately, so as to enable me to secure the services of the cutters who have been in the employ of Stewart & Co. before they leave the country, as granite workers are not to be found in Minnesota.

Should a contract be given me, I will enter into bonds at once, and will name for bondsmen Horace Thompson and John L. Merriam of this place.

I would respectfully refer you to the Hon. John J. Knox or Senator Ramsey as to my responsibility and that of my proposed bondsmen.

Very respectfully,

A. H. WILDER.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department, Washington, D. C.

A list of prices for cutting stone.

No. 4. Hammered work:	
Underpinning, per superficial foot	$1 82½
Underpinning with wash, per lineal foot	3 25
Area coping, per lineal foot	2 10
Quoins of building, per superficial foot	1 93¾
Quoins of doors and windows, per superficial foot	1 93¾
Chimney tops of 16 feet girth, 12 feet high, each	437 50
No. 3. Hammered work:	
Water table, per lineal foot	1 18¾
Steps, per lineal foot	2 25
Platforms, per superficial foot	1 20
Sills, per superficial foot	1 60
Double windows, second story, each	795 00
Double windows, third story, each	611 25
Triple windows, second story, narrow, each	900 00
Triple windows, third story, narrow, each	862 50
Triple windows, second story, wide, each	928 50
Triple windows, third story, wide, each	900 00
Circular gable windows	306 25
Belt courses, per lineal foot	7 37½
Horizontal cornice, per lineal foot	33 75
Raking cornice, per lineal foot	35 00
Turrets, 21 feet girth, 16 feet high, each	618 75
Turrets, 13 feet 4 inches girth, 12 feet high, each	456 25
No. 2. Hammered work:	
Doors with narrow side lights, each	806 25
Doors with wide side lights, each	928 50
Doors	783 75
Double windows, each	813 75

List of prices referred to in my letter of December 4, 1868.

A. H. WILDER.

ST. PAUL, *March* 22, 1869.

DEAR SIR: Inclosed please find proposition to cut granite for the United States custom-house and post office at St. Paul, Minnesota. The granite company which I represent have abundant means and better facilities for doing this work expeditiously than any other parties. If the contract is awarded me I will give undoubted security to comply with the terms thereof, and there shall be no delay in the cutting that shall retard the speedy completion of the building. I would name as my bondsmen John L. Merriam and Henry L. Carver, of St. Paul, Minnesota.

Very respectfully,

A. H. WILDER.

A. F. KNIGHT, Esq.,
Superintendent, &c.

A. F. KNIGHT, Esq., *Superintendent, &c.:*

The undersigned, resident of St. Paul, Minnesota, proposes to do the granite cutting for the St. Paul custom-house and post office for the following prices, namely, the United States to furnish tools, sheds and shops, and remove granite from sheds when cut:

Area coping, per lineal foot	$2 40
Quoins for building, per superficial foot	2 90
Quoins for doors and windows, per superficial foot	2 90
Chimney-tops, 16 feet girth, 12 feet high, each	510 00
Steps, per lineal foot	2 50
Platforms, per superficial foot	1 70

Sills, per superficial foot	$1 90
Double windows, second story, each	750 00
Double windows, third story, each	640 00
Triple windows, second story, narrow	1,075 00
Triple windows, third story, narrow	1,050 00
Triple windows, second story, wide	1,375 00
Triple windows, third story	1,350 00
Circular gable windows	300 00
Belt courses, per lineal foot	13 50
Horizontal cornice, per lineal foot	35 00
Raking cornice, per lineal foot	37 00
Turrets, 21 feet girth, 16 feet high	1,310 00
Turrets, 13 feet 4 inches girth, 12 feet high	900 00
Doors and narrow side lights	1,200 00
Doors and wide side lights	1,525 00
Double doors	825 00
Double windows	740 00
Louis-holes, large, each	75
Louis-holes, small, each	50

Very respectfully,

A. H. WILDER.

ST. PAUL, *March* 22, 1869.

Wm. A. S., clerk United States district court, district of Minnesota.
H. M. K., disbursing agent, custom-house.
A. F. K., superintendent United States custom-house.

ST. PAUL, MINNESOTA, *April* 9, 1869.

SIR: I herewith inclose estimate of granite cutting for third story of United States custom-house at St. Paul, Minnesota, and also estimate of cost of cutting outside steps and area coping. This estimate, together with the one sent you dated March 19, 1869, for cost of completion of first and second stories, completes the estimate of granite cutting for the entire building, with the exception of the inside steps and platforms.

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department.

Estimate of cost of granite cutting on third story, main cornice, and turrets, &c., of United States custom-house at St. Paul, Minnesota.

12	double windows, at $610	$7,320 00
2	triple windows, narrow, at $970	1,940 00
2	triple windows, wide, at $1,400	2,800 00
2	circular windows, large, at $250	500 00
2	circular windows, small, at $200	400 00
1,520	superficial feet quoins, at $3	4,560 00
369⅓	lineal feet horizontal cornice, at $34 25	12,649 67
134	lineal feet raking cornice, at $32 50	4,355 00
4	turrets, 21 feet 4 inches girth, 16 feet high, at $1,150	4,600 00
4	turrets, 13 feet 4 inches girth, 12 feet high, at $590	2,360 00
7	chimney tops, 16 feet 5 inches girth, 12 feet high, at $555	3,885 00
1	chimney top, 17 feet 4 inches girth, 12 feet high, at $577 50	577 50
1	chimney top, 11 feet 3 inches girth, 5 feet 6 inches high, at $225 50	225 50
	Total	46,172 67

Cost of cutting outside steps and area coping.

197	lineal feet area coping, at $2 25	$443 25
514	lineal feet steps, at $2 40	1,233 60
160	superficial feet, platforms, at $1 60	256 00
	Total	1,932 85

ST. PAUL, MINNESOTA, *April* 12, 1869.

SIR: I herewith inclose a revised proposal from Mr. A. H. Wilder for the completion of the granite cutting, which is about half way between his former proposal and my complete estimate. I do not think any contractor can be found here to undertake the work for less than he proposes. My estimate was based upon the per diem pay heretofore reported, and if it becomes necessary, as I think it will, to increase the pay twenty-five cents a day to secure the requisite force necessary to cut the granite as fast as the balance of the work can be pushed, in that case, in my opinion, Mr. Wilder's estimate is not too high.

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department.

ST. PAUL, MINNESOTA, *April* 8, 1869.

DEAR SIR: I will modify and restate my proposition of March 22, to do the granite cutting of the St. Paul custom-house and post office (the United States furnishing tools, sheds, and shops, and removing the granite from the sheds when cut) to the following prices, viz:

Area coping, per lineal foot	$2 40
Quoins of building, per superficial foot	2 60
Quoins of doors and windows, per superficial foot	3 00
Chimney tops 16 feet 5 inches girth, 12 feet high, each	555 00
Chimney tops 17 feet 4 inches girth, 12 feet high, each	577 50
Chimney tops 11 feet 3 inches girth, 5 feet 6 inches high, each	225 00
Steps, per lineal foot	2 40
Platforms, per superficial foot	1 60
Sills, per superficial foot	1 70
Double windows, second story, each	710 00
Double windows, third story, each	625 00
Triple windows, second story, narrow, each	955 00
Triple windows, third story, narrow, each	970 00
Triple windows, second story, wide, each	1,300 50
Triple windows, third story, wide, each	1,400 00
Circular gable windows, large	270 00
Circular gable windows, small	240 00
Belt course, per lineal foot	13 50
Horizontal cornice, per lineal foot	34 25
Raking cornice, per lineal foot	35 50
Turrets 21 feet 4 inches girth, 16 feet high, each	1,150 00
Turrets 13 feet 4 inches girth, 12 feet high, each	740 00
Doors with narrow side lights, each	1,035 00
Doors with wide side lights, each	1,450 00
Double doors, each	740 00
Double windows	710 00

Very respectfully,

A. H. WILDER.

A. F. KNIGHT, Esq., *St. Paul, Minnesota.*

TREASURY DEPARTMENT, *April* 16, 1869.

SIR: I have your favor of the 12th instant, inclosing Mr. Wilder's revised bid for granite cutting on the building under your charge. The bid submitted by Mr. Wilder is not sufficiently low to induce me to recall my letter of yesterday approving your estimate of the granite cutting, and authorizing you to do the work. You will therefore continue to cut the work as heretofore, and under no circumstances exceed your own estimate; but, as before advised, use every effort to come within your figures, which I consider ample though not unreasonable.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT, Esq.,
Superintendent Custom-house St. Paul, Minnesota.

ST. PAUL, MINNESOTA, *April*, 27, 1869.

SIR: I have seen Mr. A. H. Wilder and informed him of your decision in relation to his revised proposal for the completion of the granite cutting for the building under my charge; and upon my solicitation and assurance of the correctness and fairness of my estimate, he has reconsidered the subject, and now proposes, with your approval, to enter into a contract to complete the balance of the work for the prices, and in accordance with my estimate.

I infer from your letter that the above proposition will be satisfactory to the Department, and have so expressed myself to Mr. Wilder.

Very respectfully,

A. F. KNIGHT,
Superintendent United States Custom-house.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department.

Private.] OFFICE OF THE ST. PAUL PRESS,
St. Paul, Minnesota, April 27, 1869.

DEAR SIR: I learn that A. H. Wilder, president of the Granite Company, has to-day signed a contract for the granite cutting on the basis of Knight's estimate. I earnestly hope you will award him the contract on these terms, which I think you told me would be satisfactory to you. I urge it upon grounds of public interest. The contract has been taken by the Granite Company at these figures very reluctantly, for the most rigorous economy and good fortune will enable them to realize but a very narrow margin of profit. But it is highly important in every public sense and to the interests of the custom-house itself that the Granite Company should have the contract. Their contract to furnish granite for the building has been a losing one, on account of the great expense of opening the quarry, &c., and it would be a great public injury to the State and to the Mississippi Valley if they were obliged to close the quarry. Its successful operation would be a great advantage to all Government structures needing granite. I understand that the work can be done at least as cheaply under this contract as under the present plan of day wages, while, with regard to economy and good management, the company may realize a small profit, sufficient to reimburse them for a part of their losses, and enable them to continue the working of the quarry. I would therefore earnestly advise that the contract be given to the company. I learn that the terms they now accede to are far below those previously offered, which the company considered reasonable.

Please, on receipt of this, telegraph me whether their bid is accepted, and oblige,

Yours, very sincerely,

J. A. WHEELOCK.

Hon. A. B. MULLETT.

TREASURY DEPARTMENT, *May* 4, 1869.

DEAR SIR: Yours of the 27th ultimo is received. In reply I have to say that I have this day obtained the consent of the Secretary of the Treasury to accept Mr. Wilder's offer to cut the balance of the granite work, and have written Mr Knight accordingly.

Truly yours,

A. B. MULLETT,
Supervising Architect.

J. A. WHEELOCK, Esq.,
St. Paul, Minnesota.

Schedule of prices of A. H. Wilder for cutting granite work for the custom-house and post office at St. Paul, Minnesota, according to his contract, and of which this schedule is a part.

No. 4. Hammered work:	
Area coping, per lineal foot	$2 25
Quoins of building, per superficial foot	2 60
Quoins of doors and windows, per superficial foot	3 00
Chimney tops, 16 feet 5 inches girth, 12 feet high, each	555 00
Chimney tops, 17 feet 4 inches girth, 12 feet high, each	577 50
Chimney tops, 11 feet 3 inches girth, 5 feet 6 inches high, each	225 50
No. 3. Hammered work:	
Steps, per lineal foot	2 40
Platforms, per superficial foot	1 60
Sills, per superficial foot	1 70
Double windows, second story, each	632 25

Double windows, third story, each	$610 00
Triple windows, second story, narrow, each	897 75
Triple windows, third story, narrow, each	970 00
Triple windows, second story, wide, each	1,300 50
Triple windows, third story, wide, each	1,400 00
Circular gable windows, large, each	250 00
Circular gable windows, small	200 00
Belt course, first course, per lineal foot	3 00
Belt course, second course, per lineal foot	10 50
Horizontal cornice, per lineal foot	34 25
Raking cornice, per lineal foot	32 50
Turrets, 21 feet 4 inches girth, 16 feet high, each	1,150 00
Turrets, 13 feet 4 inches girth, 12 feet high, each	590 00
No. 2. Hammered work:	
Doors, with narrow side lights, first story, each	897 55
Doors, with wide side lights, first story, each	1,300 50
Triple windows, rear end, first story, each	897 75
Louis-holes, large	75
Louis-holes, small	50

TREASURY DEPARTMENT, *April* 9, 1870.

SIR: I inclose herewith copy of a letter I have this day written to Mr. A. H. Wilder, contractor for the granite cutting of the building under your charge, and have to say that you will please make no further payments to him until further orders.

Very respectfully.

A. B. MULLETT,
Supervising Architect.

A. F. KNIGHT,
Superintendent Custom-house, St. Paul, Minn.

TREASURY DEPARTMENT, *April* 9, 1870.

SIR: Mr. T. S. Newson has made charges that you and your company first induced the original contractors for the granite cutting of the St. Paul custom-house (Messrs. Stewart & Co.) to abandon their contract, and afterward conspired with them or others to increase the cost of the cutting when done by days' work, in order to obtain the contract for the remainder of the work at the present rates, which he (Newson) alleges to be exorbitant, and to have been paid in consequence of the action above referred to.

Under these circumstances, I deem it my duty to inform you that no further payments will be made you on account of the work, until Mr. Newson has had an opportunity of sustaining his allegations, or you have furnished satisfactory evidence of the falsity of the same.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

A. H. WILDER, Esq.,
Contractor for Granite Work, Custom-house, St. Paul.

ST. PAUL, *April* 15, 1870.

SIR: Your letter of the 9th instant is received, and in reply most respectfully protest against your action in suspending payment of my account for cutting granite for St. Paul custom-house, under contract made with you May, 1869. The charges made against me by T. M. Newson are false in every particular, and I see no justice in the withholding of moneys due me for labor performed under the contract, upon the report of any sorehead that may turn up.

I inclose you affidavits which I think will satisfy any reasonable set of men of the honesty of the granite-cutting contract. I will be in Washington Thursday the 21st instant, to go before the committee of investigation, and wish you could so arrange it that I can be heard on that day, as I shall be anxious to return to St. Paul the earliest moment possible.

I will bring with me the books of the Granite Company and my own account for cutting, which will fully show all the receipts and expenditures connected with the furnishing of the granite and the cutting of the same under my contract. You or the committee can then see just the status of the profit and loss account, and on examination I am inclined to think you will say the price for both granite and the cutting should be increased.

Very respectfully,

A. H. WILDER.

A. B. MULLETT,
Supervising Architect, Washington, D. C.

DISTRICT OF MINNESOTA, *ss:*

Amherst H. Wilder, of the city of St. Paul, county of Ramsey, and State of Minnesota, having been duly sworn, deposes that he is the president of the Minnesota Granite Company; that when the said company learned that the firm of Stewart & Co. were deliberating as to giving up their contract for dressing the granite to be used in the construction of the St. Paul custom-house, that the said company and those interested therein then stated to the said Stewart & Co., as was the fact, that the said company desired to introduce the said granite and bring it into notice, repute, and use, and that it was believed that the said granite would become more tractable and work softer when taken from a greater depth in it would be in the progress of opening and working the quarries, and endeavored to induce the said firm to proceed in the performance of the said contract, and to that end promised the said firm to indemnify it against loss in the performance thereof, provided the said firm would go on and use their best endeavors to perform the same; that the said firm did thereupon proceed and work at a loss, and the said company did therefore pay said firm the said loss; that at about this time the act of Congress commonly called the eight-hours law became operative, and that the said firm, for reasons which deponent believes to be truly stated in the affidavits of Messrs. Stewart, Young, and Breen, made in this matter, abandoned the said contract; that the said firm abandoned the said contract without any inducement, procurement, act, or device whatever of this deponent, or of the said Granite Company, or of any person for them or him, this deponent, whether directly or indirectly made; that neither this deponent nor any person for him or for said company with his consent or authority or otherwise, or with the consent or authority of the said company or otherwise, ever directly or indirectly endeavored to influence or in any manner advised or connived or interfered or induced the said firm or either of the members thereof, or any persons employed by them, to increase the cost of cutting when done by the day's work, or to insufficiently or inadequately perform any labor or duty in the premises, or abandon the said contract, but, on the contrary, endeavored to induce the said firm to go on and perform the same.

Deponent further says that after the said firm had abandoned the said contract he made a proposal for the said work, and that the contract therefor was awarded to him May 19, 1869; and that he took the same for the benefit of the said Granite Company; and that soon after the contract was awarded to this deponent he employed the persons who had formerly been engaged on the said work, who were on the ground, and were, as deponent is informed and believes, the only granite cutters in the West; that up to November 1, 1869, this deponent carried on the said contract for the benefit of the said Granite Company, at which time the said company, concluding that their interest was not remunerative, passed, at a meeting of said company, a resolution, of which the following is a copy, viz:

"*Resolved*, That the board of directors be, and they are hereby, authorized to transfer the contract for granite cutting, executed May 19, 1869, by the United States Government and A. H. Wilder, to any responsible individuals who will consent to assume it and to continue the work for at least six months from this date, with an obligation on the part of such individuals to release this company from any liabilities connected with said contract.

"NOVEMBER 4, 1869."

That the said company thereupon withdrew from all interest in the said contract, and left deponent to carry it out alone, which he has since done; that up to November 1, 1869, the profits of the said contract had been less by between three and four thousand dollars than the cost of quarrying and transporting the said granite; that since November 1, 1869, the said contract, though under the best possible management, has not netted 10 per cent. profit.

Deponent further says that he knows T. S. Newson; that in November 1869 the said Newson came to this deponent and requested deponent to give him, Newson, a contract to dress the granite for the said custom-house; that the said Newson then and there claimed that he could do it for 40 or 50 per cent. less than it was then costing; that deponent replied that he would be glad to have it so done, if it were possible to do it at a less rate; that deponent asked the said Newson if he could have cutting done any cheaper than deponent was having it done; that said Newson then said that he did not purpose to dress by hand, that he owned a patent right for dressing granite and proposed to do the dressing by a machine to be constructed under such patent; deponent thinks Newson stated that he procured the said patent right from Massachusetts. Deponent then asked Newson if he had the machinery ready, to which the latter answered that he had not, but that he had a model; he, the said Newson, then went on to say that he wanted the deponent to advance the money necessary to build such machine at Saint Paul, with which to do the proposed dressing; the deponent then told the said Newson that he couldn't advance the money unless Newson would give him security for the amount to be advanced, Newson having stated that the said machine would cost from $1,000 to $1,500; that Newson never gave or tendered to the deponent any security whatever, and that to the best of deponent's belief he could not do so; that the said Newson is a resident of St. Paul, and has been in that city and vicinity ever since the said custom-house was commenced, and never made, so far as deponent can learn, any complaints or charges in the premises until this deponent declined to yield to his aforesaid demands.

Deponent further says that he has always and in all things acted in this matter in entire good faith toward the United States, and respectfully protests against his compensation in

the premises being withheld or detained by reason of anything heretofore alleged in the premises, and that deponent is ready to confront the said Newson and meet all charges which he may make in this matter.

A. H. WILDER.

Subscribed and sworn before me this 15th day of April, 1870.

WM. A. SPENCER,
United States Commissioner District of Minnesota.

DISTRICT OF MINNESOTA, *ss:*

F. R. Delano, of the city of St. Paul, county of Ramsey and State of Minnesota, having been duly sworn, deposes and says: That for more than three years last past, he has been the superintendent of the first division of the St. Paul and Pacific Railroad Company, whose railroad runs from St. Paul to Sauk Rapids, Minnesota; that deponent is a stockholder in the Minnesota Granite Company; that this deponent has the contract for furnishing granite to be used in the construction of the custom-house at St. Paul aforesaid; that he has performed and is performing the said contract for the benefit of the said Granite Company, the said company sharing profits and losses; that the quarries from which the said granite is obtained are situate on the line of said railroad about seventy-three miles from said St. Paul, and about two miles from the nearest depot; that deponent at one time owned the said granite quarries and has since sold a portion of the lands upon which the same are situate to the said company; that the said granite quarries are the only quarries on the line of the said railroad which have ever been opened or worked; that there is no other granite land on the line of the said road, immediately adjacent thereto, but that the said road is the only road between the same and St. Paul, and that all granite must necessarily be transported to St. Paul over the said road.

Deponent further states that, a long time before he obtained his contract, he became convinced that the granite aforesaid was valuable for building purposes, although this view of the deponent was not then concurred in by many persons who were incredulous upon that point, and who maintained that the cost of quarrying the said granite and of transporting the same, and of cutting the same, would be so great as to render any attempt to use the same for building purposes impracticable for the aforesaid alleged reasons; that this deponent took the said contract with no view or expectation of profit therefrom, but, on the contrary, in anticipation of pecuniary loss therefrom for the reason that he was desirous of developing the said quarries and of demonstrating the value and utility of the said granite and with a view to future freights, he being an officer of the said road as aforesaid; that for these reasons the said railroad company conceded to this deponent personally a special rate of transportation of the said granite, not equal to the cost of transportation; that for the same reasons and to the same intent as aforesaid, side tracks were constructed on said railroad at the said quarries, distant as aforesaid from any station; that thus far, the actual expense of quarrying and delivering the granite at St. Paul has exceeded the compensation agreed to be paid to this deponent therefor, and that the fulfillment of the said contract will be at a loss to the contractor and those interested as above stated, at from six to eight thousand dollars.

F. R. DELANO.

Subscribed and sworn before me this 15th day of April, 1870.

WM. A. SPENCER,
United States Commissioner District of Minnesota.

STATE OF MINNESOTA, *County of Ramsey, ss:*

George L. Becker, of St. Paul, in said county, being duly sworn, deposes and says: That he is president of the first division of the St. Paul and Pacific Railroad Company; that the branch road of said company extends from St. Paul to Sauk Rapids; that for the purpose of aiding in the development of the granite quarries recently opened near St. Cloud on said line of road, said railway company, at its own expense, constructed a side track which was not required for any other purpose, to facilitate the loading of the granite quarried there and intended for the Government building at St. Paul, and gave a special rate for the transportation of such stone as was intended for such purpose: that said rate was and is below the usual rates then and now charged by said company, the motive on the part of the railway company being to assist in the development of said quarries, with a view of ultimately increasing the business of said road. GEO. L. BECKER.

Subscribed and sworn before me this 16th day of April, 1870.

[SEAL.]

JOHN H. RANDALL,
Notary Public, Ramsey County, Minnesota.

DISTRICT OF MINNESOTA, *ss:*

John Stewart, John T. Young, and Mathew Breen, of the city of St. Paul, county of Ramsey, and State of Minnesota, having been severally duly sworn, depose and say, each

for himself: That these deponents were the persons comprising the firm of Stewart & Co., who by contract dated June 1, 1868, obtained the contract to cut and dress the granite to be used in the construction of the custom-house at said St. Paul; that when the said firm bid for the said contract none of the members thereof had been in Minnesota and knew nothing of the quality of the said granite or as to the comparative difficulty of working and dressing the same, except what they were enabled to infer from a small specimen which had been sent to Washington; that after they had obtained the said contract they came to St. Paul with their employés, experimented upon the said granite and found the same to be harder and more difficult to work than they had believed it to be, or than it had been claimed to be; that it then for the first time became apparent that the said Stewart & Co. could not perform their said contract except at great pecuniary loss, and that they then seriously deliberated whether they would not be compelled to give it up; that the Minnesota Granite Company, and those interested therein, then stated to the said Stewart & Co. that if the said company was desirous to introduce the said granite and bring it into notice and use, and believing as they stated that the granite would become more tractable and work softer when taken from greater depth, as it would be in the progress of opening and working the quarries, endeavored to induce the said firm to proceed in the performance of their said contract, and to that end promised said firm to indemnify it against loss in the performance thereof; that the said firm did therefore proceed for awhile and worked at a loss, as they had anticipated, and the said company did pay to them the amount of their aforesaid loss; that at or about this time Congress enacted the law commonly called the eight-hour law, which disarranged the reasonable calculations of the said firm in the premises, and its arrangements theretofore made; and it being obliged, in consequence of such law, to pay what had theretofore been a day's full wages for eight hours' work, and the contract becoming, for these reasons, still more onerous, the said firm were compelled to abandon the same, which they did without any inducement, procurement, or connivance thereto by the said Granite Company, or any person connected therewith, or acting for it, but purely of their own motion; that after the said contract was so abandoned the said Stewart & Co., and their hands, were employed on the said work by the United States; that there were then, as they, the deponents, are informed and believe, no other granite cutters to be procured in the West; that while the said firm was doing said work and while the Government was carrying on the same, and ever since, the said Stewart, the deponent, has been the foreman thereon, and has had the direct superintendence thereof, and that while working under its said contract, and also while working for the Government in the premises, and ever since, the said firm and its employés have worked faithfully and diligently in the premises; that at all times as much work has been done and done as faithfully and as well as when the same was done by days' work, and that in the respects abovementioned there has been no difference in the amount and quality of the work done; that neither A. H. Wilder, or any other person, ever directly or indirectly endeavored to influence or in any manner advised or connived or interfered to induce the said firm or either of the members thereof or these deponents to increase the cost of cutting when done by the days' work, or to insufficiently or inadequately perform any labor or duty in the premises, or to abandon the said contract; that soon after the contract for the said work was awarded to A. H. Wilder these deponents, and the employés of the said firm of Stewart & Co., were employed by him in the premises as workmen.

JOHN STEWART.
JOHN T. YOUNG.
MATHIAS BREEN.

James H. Place, of St. Paul, in he county of Ramsey and State of Minnesota, having been duly sworn, says that he is an architect; that he has been employed in and about the construction of the custom-house at St. Paul, Minnesota, ever since work was commenced thereon; that every month since that time he has measured the granite work which has been cut and dressed therefor; that the said work, day by day, has been well and faithfully done at all times and by all parties so doing the same; that at all times, whether the same has been done by days' work or by contract, the said work has been faithfully and diligently done, and that there has been no difference, day by day, in the amount or quality of said work, whether done by the day or under any of the contracts, to the knowledge and belief of this deponent.

JAMES H. PLACE.

Subscribed and sworn to before me, this 13th day of April, 1870.

WM. A. SPENCER,
United States Commissioner, District of Minnesota.

WASHINGTON, *April* 21, 1870.

A. H. WILDER sworn and examined.

By Mr. ELA:

Question. Mr. Wilder, we have called upon you to ask of you a statement in reference to your connection with the custom-house and post office building at St. Paul.—Answer. Let me suggest to you that I am utterly ignorant of the points to which you wish me to refer; if you will suggest to me what those points are, I shall know better how to proceed.

Mr. ELA explained to the witness the allegations that had been made in reference to extravagant expenditures in connection with the custom-house and post office building at St. Paul.

WITNESS. I am president of the Minnesota Granite Company, the owners of the granite being used in the custom-house at St. Paul. That granite is furnished under a contract made by the Department with Mr. Delano. Mr. Delano is a stockholder in the Minnesota Granite Company. The contract is carried out for the company, but in his name as an individual, thinking it would be better so than in the name of the company.

Q. Is the Minnesota Granite Company an incorporated company?—A. It is.

Q. What is the amount of its capital stock?—A. Fifteen thousand dollars; about thirteen thousand being paid in. There are only fifteen or twenty stockholders in all; the shares are $50 each; I believe no one of the stockholders own over $400 of stock. When the company started, their purpose was simply to determine whether we had granite there or not, finding out that our St Paul limestone was not so durable as was at first supposed. Our purpose was to do all that we could to develope our own town and the country around us. When the Government came to want granite, and I think after they had decided to build a custom-house, we proposed to furnish granite. I do not think myself that any advertisement for proposals for granite was ever published, though an advertisement for proposals for granite cutting was. I did not suppose, and I think people generally did not suppose, that anybody in Minnesota could furnish granite, except our Granite Company, for the reason that the land on which the granite quarry was situated was owned by the Granite Company and Mr. Delano. Mr. Delano at first owned the land, and the Granite Company bought a portion of it from him, and the railroad, of which Mr. Delano is superintendent, runs across the quarry. Everybody in that country knows that no man could furnish granite at all except over that railroad.

Q. Why not?—A. Because if the railroad company would have carried granite at all, they would have charged 50 cents per hundred pounds for carrying it from the granite quarry to St. Paul. But Mr. Delano and two other members of the railroad company were stockholders in the Granite Company also. These gentlemen were very anxious to have the quarry developed; if it proved a success, it would make business for the railroad. So they said they would make the rate of transportation very low. I have been Government contractor for some years for the transportation of military stores; I am now contractor in our department; the military department turns over the stores at St. Paul; we receipt for them there; we pay 50 cents a hundred pounds for their transportation on this road; the government refunds to us that. The year before they advertised, and had to pay 57 cents. They make no classifications on this road; they charge as much for a ton of iron as for a ton of dry-goods. As there is no means of getting this granite to St. Paul except by this road, the company can dictate their own terms; if they choose to charge less than the regular tariff rate to anybody, the person so accommodated may count himself very fortunate. As I said, the capital stock of the company was $15,000—$13,000 paid in: with that money we paid Delano $5,500 for the quarry land; we have used up all of our capital in furnishing this granite; we have also used up what little profit we have made since the contract for granite came into our hands, and we are still in debt between $4,000 and $5,000. In other words, we invested $13,000 in our quarry; we have paid Delano $5,500, we have

used up $7,500; so, if we should stop to-day we must have lost, up to this time, $15,000: we have sunk our capital, put in our profits, and have not enough on hand to get us out of debt. Just about $15,000 is what we have lost. Of course, there was some expense in opening; but we have sold but little granite except what was sold for the custom-house.

Q Do I understand you to say that the profits of cutting the granite went into balance the losses of the Granite Company?—A. Yes, sir, up to the 1st day of November. The contract for cutting granite was taken in my name, individually, in April or May, 1869; but, although in my name, it was for the benefit of the Granite Company, and the profits of the contract went to pay the losses of the granite quarry.

By Mr. GRISWOLD:

Q. Then both your contracts were virtually for the Granite Company?—A. Yes, sir.

Q. The one in Mr. Delano's name, the other in your name?—A. Yes, sir.

Q. Then the Granite Company practically has both contracts?—A. It did until the 1st of November, when the Granite Company came together and decided that they did not care to have the contract for cutting run for them any longer. Since then I have been cutting the granite upon my own account individually. I have paid the workmen for cutting it, and the Government owe me for the money thus advanced. From November until now I have simply charged what I have paid out. When that is refunded, if you will allow me my salary, I should be about 10 per cent. ahead; I think not to exceed that. The last month preceding the 1st April, I think I was something like $300 ahead: the month before that I lost $150; the two months previous to that I made a little something that would help me out. Some work pays very well; some descriptions of cutting afford no profit at all, but on the contrary it costs more to cut it than I get for it. In the winter I contracted to furnish granite for the normal school building of St. Cloud. From the quarry to the place where that building is to be put up is about two miles.

Q. Is that upon the railroad?—A. It is not exactly upon the railroad. I think the stone will be hauled from the quarry to the building by teams; it will be easier than hauling it from the quarry to the railroad, loading it upon the cars, unloading it at the depot at St. Cloud, and hauling it from the depot to the normal school. Newson and others proposed to furnish granite for that building. By the way, mind you, Newson has no granite quarry open. But the St. Cloud people came to me and I contracted to furnish them granite at 70 cents per foot at the quarry. The Government pays 65 cents per foot, delivered at the custom-house. The company have furnished the refuse granite for the lower walls of the St. Cloud building, and have received payment for the same.

Q. How much do they pay for it?—A. I forgot how much.

Q. Has the company a contract with them?—A. Yes, sir.

Q. Has any appropriation been made for that normal school building?—A. There has been an appropriation but not sufficient to complete it; another appropriation has been asked for, and will undoubtedly be granted. We have a contract, signed and sealed, and binding, and they intend to go on with the building, with granite furnished by us, as soon as they get the money. The contract is not annulled; it is simply suspended.

At the time this contract was let to Mr. Delano, Mr. Newson's quarry was at least seven miles from the terminus of the railroad—from the present end of the railroad. Of course he would have to haul that granite seven or eight miles by team before striking the railroad. I pay for an ox-team and man per day, from $3 to $4; $3 50 per day is a fair average for an ox-team and man, and twelve and a half miles a day is a fair day's work for an ox-team; that is what the Government requires its teams to make.

Q. But in hauling this stone they go light one way?—A. Yes, sir; I think fifteen miles a day is about what each team would do; a team could make just about a trip a day. Certainly a team could not be loaded, driven to the railroad, unloaded, and driven back to the quarry in less than a day. And 2,000 pounds would be a good load—all we would want to put upon our teams. So you could calculate pretty nearly the expense of getting a ton of his granite to the railroad. From the railroad down, if he was charged the regular rates, he would have to pay 50 cents per hundred pounds; but suppose he paid only 25 cents per hundred; a foot of granite weights 180 pounds; that would make the expense of transportation from the end of the railroad to St. Paul, 45 cents per foot. On reaching St. Paul, we have to unload our own cars, and our own teams haul the granite to the custom-house site.

Q. But suppose the matter was placed before the railroad company in this light: Here is a large amount of granite to be transported; it is an article that is very heavy in proportion to its bulk; will you transport that granite for $2 a ton?—A. They would not do it for that. We were asked to make proposals for a bridge at St. Louis, and for furnishing granite for the stone-work of the Rock Island bridge; several applications have been made to us to bring our granite down the Mississippi River. We asked them to give us their lowest possible rates; but they offered us no such rates as we have been getting on this granite for the St. Paul custom-house; so we could not furnish it.

By Mr. ELA:

Q. Does the railroad charge for transportation according to the weight in pounds, or do they calculate so many feet to the ton?—A. They carry it by the car load, calling a car-load 10 tons, and we load and unload

Q. What do you pay for the transportation of a car-load of 10 tons?—A. Fifteen dollars, sir.

Q. A dollar and a half a ton?—A. Yes, sir; and we have not paid the railroad company yet. The railroad company have declined to transport any more for such prices.

Q. Do you call a ton a fair load for an ox-team?—A. Yes, sir; that is all an ox-team can draw. We work from 100 to 500 ox-teams the season through, and we expect our teams to haul from 1,800 to 2,000 pounds.

Q. Do you have poor roads out there?—A. No, sir; our prairie roads are generally as smooth and as hard as a floor.

Q. But you do not work a single ox-team alone?—A. Certainly.

Q. You ought to get some more Yankees out into that country, to show you how to manage with oxen.—A. We have tried the experiment of working two or three teams to a wagon; but taking all things into account, did not find it profitable. When actually on the road, going any distance, we have one man manage two or three teams.

Q. Is not your object in using only one pair of cattle to a wagon for the purpose of doubling teams when you come to bad places, so that you will not have to load and unload, and so lose time?—A. Yes, sir, in part; but we do not believe it is policy to overload our teams, so as to have to double; that takes time, too; we seldom do it in our country. I have been giving you the prices of ox-teams only; for horse-teams—a span of horses, a wagon, and a man, we have to pay $5 per day.

Q. What was the object of your company refusing to carry on the cutting contract, if it was assisting in paying the losses on the contract for furnishing granite?—A. Your appropriation run out, and it became a question whether we were obliged to go on or not; I think we were not obliged to. Still, we have a little local pride; we, of St. Paul, want our custom-house built.

Q. But if cutting was a paying operation, why quit it, even if you were not compelled to under the contract?—A. It takes $5,000 or $6,000 a month to pay the men who do the cutting; since the 1st of October I have advanced the money myself; the last money the Government sent out there was in October. The company did not care to advance the money and continue the cutting; I thought I could do it and make perhaps ten per cent. above my own compensation.

Q. What do you allow yourself for your own compensation?—A. I have not yet charged anything at all, but I think I could not give my attention to the matter for less than $3,000 per year; when we are through, if there is margin enough of profit left so that I can charge that, I do not think it would be anything out of the way for me to do so. Our company, had they been willing to advance the money necessary to pay the workmen, would still have had the profits as before; but when the appropriation ran out they said they didn't believe there was enough in it to make it worth while for them to advance the money to pay for the labor. How I will come out I do not know; I have told you how I have come out during the four months past.

Q. You made a bid, or proposition, once, did you not, at a rate lower than the present contract?—A. No, sir; I sent on a bid, but it was at a higher rate, I think.

Q. Are you sure it was not at a lower rate?—A. My impression is that it was at a higher rate; it was a year ago last December, I think, that I made a proposition to Mr. Mullett; but he told me there was no money, and he could not entertain it. Afterward I submitted two or three propositions to Mr. Knight; the first bid I made here in Washington myself.

Q. Was that bid made after consultation with the men who cut the granite?—A. No, sir. Since I have been there, I have been around and watched the men where they were working.

Q. Did you have any consultation with the old contractors with regard to the cost of cutting granite?—A. I was around when they were at work, and learned what it was costing. When the contractors first came up there, they went up to the quarry and examined it; they tried some of the stone; they said it was much harder than they had supposed, and that they did not believe they could go on with the contract; they wanted to come away then, and abandon the whole thing. The Granite Company felt as though they could not afford to have those men go back and report against the granite; that would have been the end of the quarry. When they found that they could not do the work for the price named they tried all manner of excuses to get away. The Granite Company held a meeting, and told Stewart & Co., that if they would remain and go on with the work, the company would give them $3,000 of their stock—a thousand dollars apiece, of paid up stock. Well, they then went on for three months, nearly; but finally abandoned the work. After that, the work was carried on by the day, until the contract was finally awarded to me. I never interfered with any man's cutting. I think they are working no harder for me than they did when they were working for themselves. Mr. Stewart, a Scotchman, was foreman then, and is my foreman now; he is a strictly honest and reliable man. The granite-cutters themselves do not know who they are working for; they never knew that the contract had been transferred to me.

By Mr. GRISWOLD:

Q. Your company agreed to give each of the original contractors a $1,000 worth of stock of the Granite Company. I understand that this was intended as an inducement to them to

use the granite?—A. Yes, sir; they were going to abandon it after they had been there but two or three weeks.

Q. Then you did not have to give them the stock?—A. We did give them the stock, and they hold it now. Another thing—your eight-hour law went into operation about that time, and they lost two hours a day of labor. The prices were not reduced; they had to pay as much money for eight hours' work as for ten hours' work. I am now paying granite-cutters $4 50 per day.

Q. It seems to me that is a pretty high price.—A. It may seem so, but nevertheless three of them quit work only a day or two before I came here; they are eastern men. I should have stopped granite-cutting last fall, had not the granite-cutters belonged east. Mr Knight urged me to keep on at work during the winter, so as to have the stone ready in the spring, that there might not be any delay. I consented to do so, but should not, had not the granite-cutters said that if they left work and went home they should not come back again for the short time the contract would last.

By Mr. ELA:

Q. Do they work for you eight, or ten, hours for a day's work?—A. Eight hours, sir. They dictate terms in every respect. I made every effort east, but could get no man who would go so great a distance for so short a time. So far as any tampering with the men is concerned, nothing of the sort has ever transpired.

Q. Was there any delay in furnishing the rough granite?—A. No, sir; only in the cutting.

(Mr. KNIGHT. We did have difficulty in getting rough granite when we first started.)

Q. There has been no difficulty in getting rough granite since the commencement?—A. No, sir. At the commencement we had no men in the quarry who understood how to work granite. I have seen enough of the business to know that our limestone men know nothing about the handling of granite.

Q. Are you acquainted with the limestone business?—A. Not particularly; I have been around where it was done, and seen what was going on.

Q. What is the value of limestone per foot, when quarried in St. Paul?—A. Oh, I could not give you any correct information upon that point. I have forgotten, if I ever knew. I want to tell you one thing in regard to Mr. Newson. He is an eccentric man; sometimes we call him a little crazy. I believe his granite speculation was at first a speculation for gold and silver. He thought that silver could be found under the granite rock. He came to me last fall and wanted a contract for dressing granite. He said he could save me 40 or 50 per cent. I told him that I would certainly be very happy to let him have the contract; that I did not care whom I employed; and asked him if he could hire stone-cutters at a less price than myself. He said he had a patent for a machine for dressing granite. I asked him if he had the machine made. He said no, but he had a model. I told him to get his machine ready, and I would let him go to work. He said he could not build his machine unless I would help him. I declined to build the machine for him, unless he could give me security. He asked me to build the machine, I suppose, because I had a machine-shop and foundery. He never has been able to give security, although he has been to see me two or three times about it; consequently he has not had his machine built. He felt very much put out because I would not take the risk of building the machine and taking my pay out of the cutting after he had proved the machine would work. But I did not feel like risking the expense of building the machine on its success afterward. I never heard of a machine for that kind of work that did not make the cost more than it would have been to have been done by hand. He expresses himself very much annoyed because the granite was not advertised for. The editor of the Dispatch says he does not complain at all of the price, but simply because bids were not advertised for. This whole fight has been carried on by Mr. Newson, through the Dispatch. If there is anything that you want to know in regard to the company's books, or any point upon which you wish statements made based upon them, I could give them to you. I would like to state—I do not know how broad the charges are—but I understand that it is charged that Mr. Wheelock was interested in the Granite Company and in the cutting of the stone. I simply want to say that Mr. Wheelock had no interest in the cutting, except that he has $400 of the stock of the Granite Company. I speak of this because I see it is in our home papers; the Dispatch charges Wheelock and others with being interested in this contract.

Mr. GRISWOLD. Who is Wheelock?

WITNESS. Editor of the St. Paul Press. The fact is, in pitching into the Press they think they are punishing Senator Ramsey. It is entirely a political and personal fight, and not because they think they are paying any more for the granite or for the work than it is worth.

WASHINGTON, *April* 21, 1870.

WILLIAM A. SPENCER sworn and examined.

By Mr. ELA:

Question. What is your position?—Answer. I am treasurer of the Minnesota Granite Company.

By Mr. GRISWOLD:

Q. How long have you been treasurer?—A. Since the organization of the company.

Q. When was it organized?—A. I do not remember—the papers will show. It was some time before the Government commenced to build this custom-house; not long before. We had been talking about opening that quarry for the purpose of using the stone for building purposes at St. Paul, if it should prove to be good. We had bought the land upon which it was situated of Mr. Delano, on what we considered to be favorable terms. We organized with a capital stock of $15,000; $13,000 paid in. We did not open the quarry to make money, but only as an experiment. I can corroborate Mr. Wilder's statement in regard to the Granite Company losing money on the gontract, and being still in debt to the workmen. At the meeting, of which Mr. Wilder has spoken, in November, which passed that resolution, there was quite a full representation; nearly all those who had paid in were represented at the meeting. The most of them had taken $400 of stock, and some of us had given the original contractors a hundred dollars to encourage them to proceed and not give up the work. Our mayor then and there offered to sell his stock for $200. We were going to abandon the contract entirely as a company——

Q. The cutting?—A. And the other, too; because there was no appropriation, we thought we had a right to abandon it, under the circumstances. So we concluded to lose our $400, and sell our granite lands to pay off our indebtedness.

Q. But the cutting part is paying 10 per cent., I understand?—A. I do not know.

By Mr. ELA:

Q. How much have you received from the job as profits?—A. I have not looked at the books since last November.

Q. Can you take a book and tell us?—A. The books are not here; I will have them brought here if you wish it.

By Mr. GRISWOLD:

Q. It was understood that the granite cutting was paying something last November?—A. Yes, sir.

Q. It was also understood that the furnishing of the stone was a losing business?—A. Yes, sir.

Q. Then you sold out the paying part of the business and retained that on which you were losing money?—A. It was paying then, for we had an appropriation, but when the appropriation gave out, and we got no more money, we were running in debt.

Q. And is the company now furnishing this stone at a loss?—A. Yes, sir, dating from the commencement; it cost a great deal to open the quarry.

By Mr. ELA:

Q. How much did it cost to open the quarry; to get at rock that was acceptable and desirable?—A. Well, it cost a great deal; it cost more than it ought to. We had a foreman and superintendent who claimed to be familiar with granite quarrying, but who proved to be a very inefficient man, and did not begin to do the work that was expected of him.

Q. The loss, then, was mostly in the opening of the quarry?—A. The principal amount of it, I suppose, was.

By Mr. GRISWOLD:

Q. Your loss, then, according to that, is decreasing all the time?—A. Not now; we are not interested in the cutting as a company.

Q. But you say that your principal expense was in the opening of the quarry?—A. Yes, sir.

Q. That was work for which you got nothing back for the time being?—A. Yes, sir.

Q. But when the company came to take out stone you began to get your money back?—A. Yes, sir; but we did not do it, for any member of the company will now sell the stock for anything they can get; several members have sold out their $400 of stock for $200.

Q. Why should they sell it, if, now that the quarry is fairly opened, they are getting their money back?—A. The amount of granite yet to be furnished is comparatively small, and they will not begin to get back the original cost of their stock from any profits that can be made from that quarter.

Q. What amount of granite has been furnished to the Government?—A. The Treasury Department has it all.

Q. How much did it cost to open the quarry?—A. I should say, in round numbers, about $8,000, before we got to satisfactory rock. Our only profit consists in the quarry lands opened and ready for use. In other words, if the Government got their rock for the custom-house at $15,000, that will not pay us by considerable for what we have expended, and must expend for it, by the time the amount of granite needed shall be furnished.

Q. Well, is it not worth $8,000 to have the quarry opened?—A. It would be if it was going to be used, but I never have heard of any call for it, except this one proposition for building the normal school-house.

By Mr. ELA:

Q. What is the cost per foot of quarrying the stone you are now furnishing the Government?—A. I cannot tell; the superintendent could tell you that. I only know what the treasurer's books show; they give the amounts received and paid out.

Q. Do your books show what the cost for quarrying is?—A. I think not; we employ the men by the day. We can only arrive at it, approximately, by finding the gross receipts and gross expenses, and dividing that by the number of feet of granite quarried out.

WASHINGTON, *April* 15, 1870.

WILLIAM L. BURT sworn and examined.

By Mr. CHURCHILL:

Question. What is your position?—Answer. I am postmaster at Boston, having charge of the public buildings in that city; also disbursing agent of the Treasury Department for the new post office and sub-treasury building in Boston.

Q. You have had charge of the building since the commencement?—A. Yes; sir; I purchased the land on which the building is erected.

Q. How long have you been postmaster in Boston?—A. Four years.

Q. What attention have you given to the subject of a proper construction of post office buildings?—A. I have given the subject a great deal of attention. I have examined all the post offices constructed by the Government in the United States, with but one or two small exceptions; I have examined the post office buildings in New Orleans, Cincinnati, St. Louis, Chicago, Philadelphia, Baltimore, Buffalo, Cleveland, and Detroit, and examined their plans very carefully, with a view of comparing them with the plans of the office I had made; I also examined the plans of the leading post offices in Europe, including the large London office and the offices in Paris and Berlin. I was determined to secure the best possible plan for the post office.

Q. Did you visit those buildings in Europe?—A. No, sir; but I obtained, through the Government, the plans of those buildings. I reduced all these plans to a similar scale, so as to be able to compare them carefully. The London office is a general government office, just as your Post Office building (in Washington) covers both the city post office and the Post Office Department of the Government. I wanted to avoid two great difficulties, which are found in nearly all large post offices; I wanted to arrange it so that the public could have free access to the post office, and at the same time see to it that the light was not cut off from the apartments on the inside. In our office we had to burn gas Sunday and holidays day and night. On a day as bright as this no portion of the office can be used without gas. Not only is this a great inconvenience, but the gas burns out the life of the air, rendering it very unwholesome. There has been more sickness and death in the New York post office and my own office than in any other branch of the Government service. In the New York post office the workmen are compelled to remain there only from 9 until 4. Our office is kept open day and night. Our employés are divided into three classes, each working eight hours, thus occupying the entire twenty-four hours of the day, including holidays and Sundays, except church hours on Sunday. The office closes at 10 Sunday morning, and remains closed until 4 in the afternoon, being left in charge of a watchman. There seems to have been no attention paid by the Government to the matter of the construction of post office buildings. There is not a remark in a single public document on the subject that I can find. It seems to have been taken for granted that buildings of this kind should be erected more for architecture than for use. Chicago has one of the best post office buildings in the United States; yet, with all the expense put upon it, it is utterly worthless as an office. The post offices in St. Louis and Cincinnati ought to be torn down. I have made a careful examination, and am satisfied that the Government gets no benefit from either of them, compared with the expenditure. In Chicago the outer arrangements are good; three sides are appropriated to the public. But the inside portion, used for the post office, is entirely cut off from light and air; only about one-third of the room on that floor is available for post office purposes, and that is back from the light. There is a court 14 feet wide on three sides of it, the post office portion being, as it were, a box inside of another box. No sensible man would build a barn in that way. And there two hundred men have to do their work. The St. Louis post office is even worse than that. The general plan of the Government offices has been in that style. In our new building in Boston we are endeavoring both to accommodate the public and to give ourselves light and air from the outside. In order to accomplish this, my plan was to make the first story a sort of double story; that is, to make it 30 feet high, building about it an archway 12 feet high for the public. This archway would extend upward not quite half the full height of the entire story; above it would be windows 15 feet high extending around the building, letting in the light and air directly from the outside. This plan involves that corridor passing entirely around the building, (referring to the drawings of the post office building;) on that corridor are desks from which the head clerk, the clerk of the money order department, and the clerks of the other departments, can see every man at work in the office. The postmaster can pass entirely around that corridor, communicating with his head clerks, without going among the men at work in the office. It is somewhat after the style of the dead-letter office here, where any person above can over-

look the table below. By this means all the space is utilized, the public have free access to the post office, and free admission of light and air is given to the room. It involves no increased cost, and improves the appearance of the building rather than otherwise. In the next place I found these offices, especially the continental offices, all cut up into little rooms. Every man is in a little room by himself, and there either does his duty or fails to do it, with no one to keep an eye upon him. Our office is constructed without partition or break, 250 feet long and over 115 feet wide, uninterrupted except by light iron columns. By this arrangement there is a free circulation of air, and the entire building can be looked over at a glance. This makes the whole office a guard over the whole office. The office is also more easily heated; this is a matter of considerable importance, especially in buildings in a northern climate. Another thing—you can ventilate a large room more efficiently than you can several small ones. A large room properly heated can be kept at a mean average temperature with much less trouble than several small ones, and can be managed by one man, while in the other case a large number are necessary. The plans for this office were prepared by our own architect, and at our own expense. Those plans were then brought here and placed before the Government.

Q. Did you examine the plan of the New York post office, as got up by the five New York architects?—A. Yes, sir; I went to New York with Governor Andrew, of Massachusetts, who was on the commission for our post office, and made a full examination of those plans there. The result of my examination of those plans, (not to criticise anybody,) was not favorable; especially with regard to the points which I have mentioned, and all of which I consider of more importance than the mere architectural beauty of the building. The work of the post office is done on the lower floor, the rooms above get light and air, but those on the lower floor do not. There is one redeeming feature in connection with the New York post office. The first intention was to put the building fully out to the line of the land owned by the Government. It was claimed that the space on the north side would remain permanently unoccupied, so that the Government would be sure of 250 or 275 feet perpetually open to the light and air. This would be so if the government of the State or city of New York should give that ground to the United States Government, or give a pledge which there would be no possibility of repealing, that it should never be used for other purposes. But the Government had no rights in relation to the matter; and on my second or third trip to New York, after seeing A. T. Stewart, I went and saw Mayor Hall, and he agreed with me that it would be better to set the building back so as to have a public plaza, that people coming to the office might not be run over. People coming in on the horse-cars, as thousands daily do, have to cross Broadway, up and down which a continuous line of carriages is passing. In order to accommodate the people it was necessary to give them some space on the post office side. When the time arrived for commencing the building, the question arose whether to use the old plan, or adopt the new one. Mr. Mullett, in conversation about the matter with me, told me that unless the State and city of New York gave him the land he required he was satisfied it would some day compel the United States to pay an exorbitant price for it; in fact, that there was some such scheme actually in the wind in relation to it.

Q. That building was not put up on the line eventually?—A. No, sir. The rear wall is not up at all yet; but the plans for the building bring it out 24 feet from the line of the park, so as to leave a space in the rear 24 feet wide under the control of the Government. This 24 feet is not lost for the purposes of the post office, except for that portion of the building above; and there, they seemed to think, they will have room enough without it. The 24 feet saved for the use of mail-wagons, and by and by when the Hudson River, Harlem and Boston roads bring their cars into the same depot all together, the plan is to bring the postal-cars directly into this area—practically, into the building—without change; so they can put the mails in and begin work in the postal-car before leaving the city, in fact, while the car is still within the post office building. The additional expense will be a mere trifle.

By the CHAIRMAN:

Q. According to these five plans, this carriage-way was in the body of the building itself?—A Yes, sir; the carriage-way was trussed over, and the body of the building put up above it.

Q. Is that not the way in the plan you now speak of?—A. No, sir; the building is carried up solid, and the passage-way comes outside, covered by a projecting screen, that looks like a balustrade. I will say that the present plan and the former plan make very little difference as to post office room. The mails come in and are delivered into the basement; the basement flight is used for the receipt and discharge of mails; the city post office is on the floor above. The drive-ways are made on a descending grade, terminating in the basement. The mails ought not to be received and discharged in the same part of the building where the city post office work is done. We are to do all this in the basement rooms: the mails which are not to be distributed in the city never go up to daylight. We frequently take in from fifteen to twenty-five tons of mail matter a day. On the floor above, by Mr. Mullett's arrangement, there is by actual calculation as many superficial feet of space for post office purposes as under the old arrangement, the building being constructed with reference to post office wants, and not simply with reference to architecture. As it was before, the only way in which the architecture of the building was made to conform to these wants as a

post office was in the addition of an immense truss to drive under, and have that truss carry the 115 feet of building above. So far as the rest of the building was concerned, it might as well have been built for a warehouse or a store, and the truss did not accomplish anything that could not have been accomplished in some other way and with less expense. The actual gain by Mr. Mullett's plan is upward of 10,000 feet. Mr. A. T. Stewart, who is a very practical man—a perfect marvel of a man for minutiæ—he strongly opposed the former plan; he said the Government could not afford to make any such experiment. He showed that the cost of the plan increased in mathematical ratio by every foot; and the insecurity was so great an objection that he would not build in that way even if it cost no more. But the expense would have been enormous.

Q. What would have been the additional expense?—A. I cannot say; there is no such truss in any public building in the United States. As the length of the truss increases, the insecurity increases very rapidly. It is not so much that there is danger of its breaking as that there is no way to control its warping; the instant you get a strain upon it, it warps laterally. You will understand that by reference to a long board set up on edge with the ends supported; a weight placed upon its center would not break it by direct downward pressure, but would cause it to spring or warp in a lateral direction.

Q. But what is the necessity of having this truss?—A. I confess I do not see the necessity myself. I do not think the architects ought to be charged with it. In talking with one or two of them, I think they expressed themselves to the effect that this part of the plan was none of theirs; that they put it in because they were required to. I understand the idea came from the postmaster of New York. When we began our building in Boston, I had plans and estimates made at home. On coming here and talking with Senators Sumner and Wilson, I told them that it seemed to me we had better meet this matter squarely and have our estimates made beforehand. They said, by all means; and so it was done. We asked no appropriation until the plans were completed. We, in Boston, were in an embarrassing and unpleasant position; we were simply tenants at will; we were in as bad a condition for lack of a post office as they were in New York—and that is as bad as can be. I consulted with our Senators from time to time; I went to Mr. Muilett and asked him, as a request from our Senators, that full estimates for the construction of our building should be laid before the Secretary of the Treasury and communicated to Congress before a dollar was expended. Estimates were made for the entire building, and put upon the books of the Department; we never asked a dollar until that was done. In my opinion, all our public buildings should be built in that way. This plan of making an appropriation of $50,000 or $25,000 to commence a building that is to cost a million or a million and a half of doilars, is, in my opinion, the worst possible policy. In that way the departments shirk the responsibility of the heavy expense of putting up these buildings. I say, let everything be clearly understood from the start. Our building is the only one I know of in the United States whose projectors were willing to face Congress squarely and tell exactly what they wanted. Having made these estimates, the appropriation for the purchase of the land was made, and the land bought. The next appropriation was not for the building itself, but for the basement of the building—to bring it up to a level with the sidewalk. Our expenditures thus far have come considerably inside of our estimates, for prices are not as high now as when our estimates were made; we have $38,000 left of an appropriation of $200,000. We have kept a full account of our work; there has not been a day but what we have known exactly where we were.

By the CHAIRMAN:

Q. How is the work done; by contract or by the day?—A. The work is done in this way: we require various things; for instance, we required iron for the completion of our iron work. We invited bids for that iron work; when the day arrived the bids were opened; they were found to range from 3½ to 5½ cents per pound. The result was we obtained iron at 3½ cents per pound, delivered on the spot, the contractor furnishing patterns and all transportation. We made a great saving in our wrought-iron work in the same way. We advertised for each thing separately—lime, sand, cement, &c.

Q. What was your lowest bid for cement?—A. Our lowest bid for cement was $2 40. I found out that a competition had been entered into to obtain excessive prices, and I rejected all the bids. After the bids were rejected, verbal offers were made me by some of the very parties who had made these bids, to furnish cement at less rates. I eventually procured it at $1 95. We have had nearly the same trouble with regard to everything that has been wanted; and the same controversy by each man who bid being disaffected, and afterward making all sorts of complaints. We had the same trouble about granite. I said to each quarryman, if you think we are being imposed upon, you will do us a great favor if you will go to these men and keep a good watch upon them, and see that they do not cheat us. I said to all, you can see each bid, each offer, every man's name. A man says, "I want to furnish gas pipe;" I take down his name, and whenever that portion of the work is advertised he receives a notice from my hands. I began under the eight-hour law, but refused to pay a full day's wages, except for ten hours' work; I refused for one month, when I received an order from the Government to increase the pay one-fifth. Under these instructions I gave this pay, additional for the preceding month, to men who had no idea of getting the

money. Our contracts are the lowest in the United States. Our granite could be taken up and shipped to New York, and still make a saving of 10 per cent. on the price now paid for granite there.

Q. What do you pay for granite?—A. We pay 39¾ cents per foot, quarried and delivered on our site, for the foundation. We pay in addition to that, for bankage and wharfage, what amounts to about 3 cents more, making in all about 43 cents for foundation stone.

Q. Does that 43 cents cover the price for all sizes?—A. For all foundation stone; the provision for increase of price does not apply to foundation stone at all. Over half the stone used in the foundation are very large, but we pay nothing extra on account of it. Nothing extra is paid by the Government for stone of extra size, excepting such as are specially ordered and shown on the architectural plans. A contractor cannot charge extra for stone of extra size furnished, simply because it is his whim to do so; they must be furnished to supply an architectural want, and in pursuance of a direct order of the Government.

Q. What is meant by bankage?—A. That is what a stone is worth as it lies in the bank; that goes to the owner of the soil.

Q. Is the granite paid for by its measurement as it lies in the bank?—A. No, sir; we measure the granite in the wall after it is laid.

Q. Then you do not pay for what is wasted in the cutting?—A. No, sir; the waste is not measured; the stone in the wall is the stone we pay for.

Q. If you make a calculation of the quantity of stone in a given space, say a hundred cubic feet, and then quarry out the stone, will the quantity quarried out measure a hundred feet?—A. O, no; you will strike seams, and discolored portions, and stone that will not split free; and the waste stone amounts to almost as much as the good stone.

Q. Then about 50 per cent. of what is taken out of the quarry is waste?—A. It varies much; in some quarries all of 50 per cent.; in others the waste is almost nothing.

Q. Do the quarrymen measure the stone?—A. No, sir; they have nothing to do with it; they are not allowed to be present when the measurement is made.

Q. By whom is the stone measured?—A. By the surveyor of the city of Boston, Mr. Davis. I made a request of the Government, that during the construction of this building, Mr. Davis should be permitted to make the measurements, and to keep them himself, and to let no one else see them. The surveyor, the superintendent, and myself, are the only persons who know anything about them.

Q. Will you please explain about this increase of price one cent a foot for all stone containing over 20 cubic feet?—A. I presume you suppose that if a block measures one foot over the 20 cubic feet, the price will be one cent additional only upon that extra foot. This is not so; the extra cent applies to every cubic foot in the block, making upon a block of 21 cubic feet an addition of 21 cents. If the block measures 25 feet, we pay 5 cents additional on each foot. This is the general rule with regard to stone in Massachusetts. The court recognizes this rule of one cent for each additional foot, to mean one cent for each cubic foot in the entire block.

Q. Is the dressing of the stone done by contract, or by days' work?—A. By days' work; the men are paid by the Government at the close of each month.

Q. And the putting together of this material?—A. That is done by the day. These stones are quarried of a certain size; every stone is cut after a pattern made by a carpenter; every stone is marked, numbered, and lettered. I have kept track of this matter so completely that I know the work done by every man upon every stone for every day in the year; I know the cost of every stone that has gone into the building.

Q. Where is the dressing done?—A. At the quarry.

Q. What allowance do you make to the contractor for doing the work?—A. Fifteen per cent. in addition to the actual expense.

Q. The entire expense of the granite?—A. No; the entire expense of the dressing; we pay for the work. The contractor is obliged to furnish a man himself, paid by himself, who takes charge of the work, lays it out, supervises the men, sees that the work is brought down from the quarry and delivered where the cutting is done.

Q. Where does your duty commence?—A. With the paying of these men.

Q. But suppose a stone is cut wrong, and comes back from the quarry to Boston, who bears the loss?—A. The workman gets his pay from the contractor, but the contractor does not get his pay from us. We actually pay the workmen, but he is made responsible for the work.

Q. The workmen, then, are his workmen?—A. In a certain sense; but they are the workmen of the Government in this way: If they were his workmen, he might pay them $10 a day, and ask us to pay 15 per cent. on that.

Q. Who has charge of that matter?—A. There is a superintendent in Boston; besides this, we have an additional man, an architect, who looks after this work; he fixes the price of the work of these men; if a man is worth $3 a day, he gets it; if $4 a day, he gets that. There was a sort of organization which claimed the right to fix the price of work, and demanded $4 a day for all the men employed upon the work; they endeavored to create dissatisfaction. But we would not pay the bills, and that soon brought them to terms. Men who are able to supervise a gang of workmen, or act in the capacity of foremen, as it were,

receive extra pay. No man has gone into the quarry who has not been paid by the Government, at a price fixed by the officer of the Government.

Q. What is the highest price paid to any man employed there?—A. Five dollars per day.

Q. Will you explain to us why it is that this 15 per cent. is paid upon the work?—A. No man in Boston would undertake a contract of that kind, except upon a basis which would assure him of at least 15 per cent. profit; more likely 25 or 30 per cent. The ordinary work of the last three years has paid even larger profits than this; at least, in making their estimates, men figure for that. I do not think you could make a contract in which the contractor would not add more than that, beyond all probable expenses.

Q. If it pleased you to receive the stone in the rough in Boston, would you have the right to do so; and could you have the stone dressed by some other party, or in any way that suited yourself?—A. Yes, sir.

Q. Which would be the the most advantageous—to have the stone delivered in the rough, and dressed in Boston, or to have it delivered and dressed as you now have it, the Government paying the additional 15 per cent.?—A. Well, you can bring that right home to your own practice. In Boston we have all the temptations of a large city. In any gang of workmen that you can get together, there are always many who, more or less given to drinking, go off on sprees, and are not fit for work for two or three days after; there are others who are disposed to make trouble among their fellow-workmen, so that with a gang of a hundred or two hundred workmen you cannot begin to get the same amount of work out of them in a city that you can with them quietly at work at a quarry, where they go and stay week after week.

Q. But suppose you run a stone-yard for the Government in the vicinity of the quarry, and have the work done by Government workmen, paying nobody any 15 per cent.?—A. As to whether it would be better to pay the 15 per cent. in the way we do or to do the work ourselves is a question I cannot answer. As for me, I can do no more than I do. I cannot go out and hunt up and hire men; if they should get up a strike I could not undertake to go and look after the matter; and there are a hundred other things that need some watchful eye and guiding hand. The man who does take upon himself all this labor and respensibility receives 15 per cent., which is intended to fairly cover his labor in connection with the position, and perhaps afford him some small profit.

Q. Do you know what the usage regarding this matter is by builders in contracts with private parties?—A. I talked with three or four men who came to Boston to testify before our committee, in reference to this part of our contract. One of these men was Mr. Patterson, of Hartford, Connecticut, the owner of a large free-stone quarry, and who has the original granite quarry at Westerloo, Rhode Island. He said that stone could not be furnished at a profit for considerably more than we are now paying; that he would not undertake the job unless he were certain of a profit of at least 25 per cent.; that in his business, taking one year with another, with all the chances in the matter of workmen, the difficulty of obtaining them at one time, and the surplus on hand at another, 25 per cent was the smallest margin of profit at which he would take a contract of that sort. Mr. Sheldon, of the Rockport Company, said the same thing. I conclude that if any one should undertake to do the work at lower figures it would be with a view to some collateral speculation that would make up the difference.

Q. The risk of transportation is with the owner of the quarry?—A. Entirely. If the vessel is lost and the cargo goes to the bottom he would get nothing.

Q. When the stone are dressed at the quarry,do you pay any insurance?—A. My impression is that there is a nominal insurance.

Q. Suppose it is not insured and should be lost—whose would be the loss?—A. Would it not be our loss, because our men did the work upon it and were paid by the day?

Q. But does not the 15 per cent. cover that?—A. I think not.

Q. He would certainly get nothing for his stone; but the question is——A. You do not accept it at the dressing shed; if you did you would pay the transportation upon it.

Q. The question is, who would lose the work done upon it by day's work; no doubt, the quarry-man loses his stone, bankage, and wharfage; but who loses the work expended upon it?—A. Well, I think we would lose that, unless it were insured.

Q. If the insurance is counted in as a part of the expenditure, the Government would have to pay 15 per cent. on the insurance?—A. Well, that would be a mere bagatelle--it would not amount to enough to pay for the writing paper the insurance policy was written on.

Q. But if the stone were to be taken to New York. then the insurance would amount to something of an item.—A. Oh, yes; but Cape Ann is right there in Boston Harbor, as you might say; the quarry is right on the ocean, close to deep water, upon which schooners can come right up to the shore and load with granite; and I do not recollect that I ever heard of a stone vessel being wrecked. Consequently, insurance is very light.

Q. How long would it take to prepare for presentation to Congress the plans and drawings of a building like that for the new post office in New York?—A. The design of a building is a very simple affair. The plan of a building goes a little further along; and when you come down to the working drawings of a building, those of the New York post office could not be prepared in six months, with all the men in this Department. When you come to arranging for every separate stone, fixing its size precisely to within half an inch, it

requires the greatest attention, and care, and calculation. It would be as impossible to furnish the present Congress with the working plans of the New York post office as for a man to fly. But plans could be made, upon which a reliable estimate could be based, in much less time. Full working drawings would not be necessary.

Q. What do you find to be the cost of dressing stone in Boston; or have you not made any estimate upon that point?—A. I know the cost of dressing every stone in every pier of the Boston post office. The cost has averaged 90 cents and a fraction per foot for dressing and putting in place.

Q. Do you mean that the stone, dressed and put in place, cost that amount?—A. No; I mean that the stone costs so much per foot delivered; then, the dressing and putting in place costs 90 cents a foot. The cost has been, I think, more than it will be hereafter. I shall be disappointed if, throughout the building, the cost of dressing and putting up the stone costs over 80 cents per foot.

Q. Then the dressing and putting up amounts to about twice the price of the stone?—A Yes, sir; and a little more. When you come to dressing for caps and sills of windows scrolls, &c., the surface measures faster than in plain work.

Q. What would you say of a piece of work in which the cost for dressing and putting together should be five or six times the cost of the stone?—A. I should want to look at the stone. Some stone is very hard to dress and get to surface. With the stone of New England you know what you can depend upon; it dresses down very nicely; but take the stone of Seneca and Cayuga Lakes, and it cannot be dressed for four times the cost of the stone; one stroke of a chisel will unexpectedly take out a chip half an inch below where you intended the surface to be, and perhaps utterly spoil the stone for the purpose designed. Our New England granite is very reliable.

By Mr. GRISWOLD, (who had not been present at the earlier portion of the examination:)

Q. I understand the superintendent gets 15 per cent.?—A. Not the superintendent; the superintendent gets $8 a day.

Q. Who gets the 15 per cent.?—A. The man who does the cutting of the stone, and the boxing and delivering it at the site. In this case it happens to be the same party who owns the quarry.

Q. A contract is made with him that he shall quarry at so much?—A. Yes, sir, quarry and deliver. He quarries and delivers for so much; then he cuts it for so much.

Q. And you pay him for the stone as measured in the building?—A. Yes, sir; nothing is paid on anything that does not go into the building.

Q. The contractor hires the workmen?—A. Yes, sir.

Q. And the Government pays them?—A. Yes, sir.

Q. And he has 15 per cent. upon the disbursements?—A. Yes, sir.

Q. Will you state in detail what the service is which he performs for that 15 per cent. which is paid him?—A. Well, suppose an order comes to-day for a certain lot of stone. A pattern is made for every stone, and placed in the workman's hands; the stone is quarried and given to the workman; it is also numbered, and lettered, and entered on a book. After that stone is laid in its place in the building, it is paid for, and not before. If the stone for any reason proves unsuitable, and does not go into the building, he gets no pay for it. The contractor also has to obtain stone-cutters, and supervise everything relating to the quarries at his own expense. He keeps the time of every man, marks the stones, makes the entry there—in the book kept for that purpose; sees that I get the same invoice that is invoiced on the vessel, and that between our agent at the quarry and our men at work in Boston we get every dollar's worth of stone and work that we pay for. Any loss or risk falls upon him, as middle man in the work. He is there at the work, on an average four days in the week himself, and his foreman is there all the time, and neither of them have any salary from us—their names are not on our pay-roll. He gets workmen there, and gets them places to stay, and a great many other things necessarily connected with the supervision of such a gang of workmen. He must see to it that work is done, or his 15 per cent would not amount to anything. This is what we give him the 15 per cent. for. If we did'nt pay it to him, we would have to pay some other man for doing it, and promptness and speed are best secured by so arranging matters that the more work is done the more pay he gets.

Q. What will be the gross amount paid for the cutting of the stone for this building?—A. I calculated that on that contract this man would get, including the 15 per cent. paid for this sort of supervision, between $30,000 and $40,000. You understand we do not pay the 15 per cent. on the work done by our men in Boston. An architect in Boston to supervise the work, and take the same responsibility, would receive from one and a half to two and a half times as much, taking a per cent. on the total expenditures of the entire work.

Q. That is to say, somewhere about $75,000 or $80,000?—A. Yes, sir; that is, if he made the contract including this other work.

A. How much are you paid?—A. Not a cent—never have been, and never expect to be.

Q. How much does Mr. Bryant get?—A. Eight dollars a day. He is a man with twenty-five years practical experience, and whose services are invaluable. If you should go to him to get him to do what he is now doing simply as a matter of money, it would cost you a

great deal more than you are now paying him. It is just so here; take the work done in the architect's department of this Government, and it would cost private individuals, to get the same work done, more than $100,000 for every $10,000 now paid. In the New York post-office building the architect or architects were to have 5 per cent. on the first $250,000 expended; 3 per cent. for the second $250,000; and 2 per cent. on the balance—and this without any expense whatever for anything whatever. The estimates were for three and a half millions; besides a certain amount for the plans accepted. The Government paid out $18,000 cash for those architects' plans alone. The entire expense, including the per centage, would have been between $70,000 and $80,000; and I think that a fair price for that kind and amount of service in New York city to-day.

Q. How long ought it to take to finish that building?—A. The Boston building can be finished in twelve months from to-day, and you ought to be in the New York building before that time.

Q. According to that—if an architect gets $80,000 for one year's work—he need not take more than one or two contracts a year to secure for himself a comfortable income?—A. Yes, but it would not be above the rates that are paid for that kind of work in New York City. The architects of such buildings as the large warehouses and hotels in New York are paid from 3 to 5 per cent. on the gross expenditures.

Q. What proportion ought the raw material of a building to bear, as regards expense, to the cutting and finishing of the material?—A. It is impossible to answer that question, as it depends entirely upon the character of the architecture, the ornaments upon the building, &c. You can put five or six times the cost of the material upon a building in the labor of ornamenting it. Besides you may have a material that is difficult to work, and thereby exposes you to great loss.

Q. [Referring to a diagram of a post office building which lay upon the table.] You have referred to the difficulty of constructing a post office building so as to accomodate the public, and at the same time afford the men in the office sufficient air and light. Why not have a passage way running through the middle of the entire building by which the public could reach the various offices?—A. O, that would cut up the building too much; the offices would be on opposite sides of that passage way, and the men employed in them would have to be continually crossing and recrossing it; and in many other ways it would be inconvenient.

TREASURY DEPARTMENT,
Office of Supervising Architect, June 4, 1870.

SIR: I have to acknowledge the receipt of your letter o the 28th ultimo, and to say, in reply, that I have been unable to furnish the information desired by you, in consequence of my absence in the South.

With regard to your inquiries I have to say that the expenses of the photographic establishment are not chargeable to any of the public works, the office being duly authorized by law as a portion of the office of the Secretary of the Treasury, the general supervision of it being vested in this office. As a consequence, the expenses for stationery, paper, &c., are payable out of the appropriation for the contingent expenses of the Secretary's office, and, therefore, no specific account has been kept of the number of drawings for the different buildings, an aggregate list only of the drawings being kept, except where the work is done for other Departments or Bureaus.

The expenses of the office per annum are as follows, viz:

Salary of photographer	$2,500 00
Salary of assistant photographer	1,374 43
Salary of second assistant photographer	832 00
Albumen and all other paper	304 35
Granulated silver	278 93
Gold	128 05
Chemicals, &c	69 30
Muslin	56 10
Total	5,543 16

The following is the number of photographs that have been prepared, viz:

Of architectural and miscellaneous drawings	15,459
Of counterfeit notes for Treasurer United States	572
Of drawings for architect United States Capitol	182
Of drawings for Light-house Board	121
Of drawings for revenue marine	119
Of maps of postal routes for Post Office Department	135

There have also been prepared 900 negatives, which form a part of the stock of the office, that will enable us to reproduce any drawing that has been prepared at any time at a nominal expense. These negatives alone are worth to-day to the Government more than the

entire expense of the photographic office. By them the Department can reproduce, for a few cents, drawings that would cost from $5 to $50 to reproduce in any other manner, except by lithography, which has been found by experiment to be more tedious, more costly, less accurate, and in every way inferior for our purposes, to the present system. As regards the cost of the work, its cheapness is so well understood that the Department is compelled to decline, almost daily, applications from private parties to do work for them, the cost to be paid into the Treasury.

I may also add that during the war all the military maps were photographed in this office. This, you will readily perceive, was one of the most confidential positions that existed at that time, as the maps were of so secret a nature that even cabinet ministers were not allowed access to them, except by permission of the War Department.

It would be absolutely impossible to transact the business of the office with any degree of promptness, regularity, or economy without this establishment; and I may also add, that it is in almost daily use in photographing original papers, vouchers, bonds, notes, and other documents, for use in the United States courts in important suits, as well as for the use of the secret service division.

I regret that the information cannot be given you in a more accurate form, but to do so would involve the services of an additional clerk, the business done being sufficient to employ the entire time of one man to keep such a record as your committee desires. The advantages to be derived from this would not, in my opinion, justify such an expenditure, but should your committee deem it advisable, I should be very glad to avail myself of such an appointment.

In addition to the duties I have already specified, the large working drawings of the office and maps for the use of the Department are all backed with linen in that establishment, which alone occupies the greater part of the labor of one man.

Trusting this information will prove sufficient for your purpose, I remain,

Very respectfully,

A. B. MULLETT,
Supervising Architect.

Hon. JOHN C. CHURCHILL,
Chairman Committee on Expenditures
on Public Buildings, House of Representatives.

WASHINGTON, D. C., *June* 11, 1870.

ALEXANDER R. SHEPHERD sworn and examined.

By the CHAIRMAN:

Question. State your residence and occupation.—Answer. I reside in Washington; my business is plumbing, gas fitting, roofing, &c.

Q. Are you connected with the Vaux anti-freezing pump, and the Vaux roofing patent?—A. I am.

Q. In what way are you connected with it?—A. I am treasurer of the company—the Vaux Anti-freezing Pipe and Roofing Company.

Q. Is that an incorporated company?—A. Yes, sir; it is incorporated under the State laws of New York.

Q. How was the company organized?—A. William S. Carr is president; his place of business is 110 Sixth street, New York. I am the treasurer, as I said.

Q. Was it incorporated under special laws?—A. No, sir; under the general incorporation act.

Q. What patents are the property of that company?—A. Two patents; one for a corrugated roof, and one for the prevention of freezing in pipes.

Q. By whom were those patents procured?—A. By Mr. E. P. Vaux.

Q. Formerly connected with the Treasury Department?—A. Yes, sir; he was for many years foreman of the plumbing work there.

Q. What is the principle of the anti-freezing pipe patent?—A. It is a double pipe; an inside pipe, through which the water flows, protected by an outside incasing pipe made perfectly tight; and the air acting as a non-conductor, prevents the freezing of the inner pipe.

Q. What is the principle of this patent in roofing?—A. It is putting grooves in the roof at a distance of 14 or 18 inches, or in some cases two feet apart, to allow for the contraction and expansion of the metal. The trouble with roofing generally is the expansion and contraction of the breaks of the joints. That is the case with regard to the roofing on the Interior Department and the Post Office Department here; the roofs are almost utterly worthless; the alternate expansion and contraction has broken the joints and made the roofs leaky. These grooves will allow the contraction and expansion of the metal without interfering with the joints.

By Mr. ELA:

Q. These grooves run up and down the roof.—A. Yes, sir.

Q. Is there anything peculiar about the process by which they are produced in the mate-

rial used?—A. No, sir; it is very simple; it merely consists in bending the material over an iron rod—making a "bead," as we term it.

Q. Who are the stockholders in that company?—A. E. P. Vaux, Thomas Brown, William H. Brown, and myself. There were one or two other parties. J. R. Elvans was in it for a while.

Q. Has Mr. Mullett any interest in it?—A. None whatever.

Q. Did he ever have any?—A. Well, the facts regarding that are simply these: Vaux, whom I knew very well, is a clever, good fellow, a first-rate fellow, but a man of no business capacity whatever. He bothered me for a space of six or eight months about his patent roofing and patent pipes. I examined into them, and became convinced they were a good thing. Mr. Mullett, it appears had advanced him the money to get his patents out, and had used them in several public buildings. The roofing had been used for the north roof of the Treasury Department, and on the custom-house in Georgetown, and one or two other buildings. In return for Mr. Mullett's advancing the money to pay the expense of getting out the patent, Vaux transferred to him a certain interest in the patent. I am not certain, I think it was a little less than half. Vaux worried me a good deal about this patent: he said that Mr. Mullett had used it on his buildings, and had not allowed him anything for it; that he did not think it was right; but Mr. Mullett objected, refusing to allow the claim for royalty on the patent so long as he held an interest in the patent. I had a great deal to do, and fought off for a long time. Finally, Vaux literally badgered me into seeing Mr. Mullett and asking him what he would sell out his right for. After a good deal of dickering I bought Mr. Mullett's share in the patent for Mr. Carr, of New York, and myself, giving Mr. Mullett $6,000 for it. My expectation at that time was that, after acquiring possession of the patent, I could get from Mr. Mullett a royalty for its use. I really do not think Mr. Mullet has acted right in the matter; he has refused to pay anything. The Government actually owes us $4,000 or $5,000 on that account.

By the CHAIRMAN:

Q. Do I understand that you purchased any claim for the use of the patent previous to the time of its purchase?—A. I bought all his right, title, and interest in the patent. I supposed that would include something due from the Government for the use of the patent, but we never have obtained anything. It has not been our object to make a fight on it, or anything of that kind; if we should, I really think the courts would sustain our claim. But we have thought it not worth while, and have let it go. After purchasing the patent, Mr. Carr and I consulted together and made a proposition to the Secretary of the Treasury. We, that is, myself, Mr. Vaux, and these other parties, were now the proprietors of this patent pipe and roofing. It had been tested by the Department and they were thoroughly satisfied with it. The company undertook to do whatever roofing the Department wanted, and whatever plumbing it wanted, on certain terms and conditions. These were that we should receive—I will remark here that there were a good many buildings being put up at a distance from where there were plumbers and workers in metals, so that it was difficult to get men to do the work in such places—we undertook to do whatever plumbing and roofing they wanted, and to warrant our work for ten years, on these conditions: we were to receive a commission of 18 or 20 cents profit upon the net cost of the labor and material and of the work to us, and we, for the use of the patent, receiving on the roof 10 cents per square foot as royalty, and on the pipe 10 cents per lineal foot. The proposition was reduced as to the piping: when I submitted the proposition to the Secretary of the Treasury he cut down the commission, saying, that if we would take 15 per cent., he would accept the proposition, and where roofs and pipe of that kind were needed we should have the orders. A formal arrangement of that kind was made in the name of William S. Carr & Co. Shortly afterward we found it was best to put the thing into the shape of an incorporated company, and we accordingly incorporated under the laws of the State of New York. I attended to the business here, finding it more convenient to do so. Since that time we have put on, I suppose, half a dozen roofs, and done $40,000 or $50,000 worth of work for the Government.

Q. Of what kind?—A. We have put on roofs for Government buildings; the court-house at Richmond, Virginia; the custom-house at Portsmouth, New Hampshire; the post office at New Haven, Connecticut; we did some work at Portland, Maine; some at Madison, Wisconsin; some at Des Moines, Iowa. We put on a roof for Mr. Mullett at Cairo, Illinois; he had the material there, everything but the copper, and was very anxious to get it roofed in to save the building; so was Mr. Logan. They asked us to do it and wait for the pay until an appropriation was made. We put on a roof at Mobile, Alabama.

Q. With whom were these arrangements made of which you speak?—A. With Mr. Boutwell.

Q. When?—A. Something under a year ago, I think.

Q. And this work you have named has been done since that time?—A. Yes, sir.

Q. Under that contract, or an agreement?—A. Yes, sir.

Q. Was there any understanding in your purchase of Mr. Mullett's interest, that you should have this claim for royalty for work that had already been done for the Government?—A. No, sir; my impression is directly contrary, that so far as he was concerned I should

never be able to get it. I thought to get it through an appeal to the Secretary, or in some other way.

Q. What do you understand by the net cost of the work done by you to these buildings? —A. The net cost of the material and the labor. With regard to this contract and how it works with the Government, you will see that the Government saves one-fourth on the work from the fact that our men work ten hours a day, while men in the Government employ work but eight hours a day. Ours being a private contract, our men working not for the Government, but for us, we exact ten hours a day. That is one of the things we looked at when the agreement was made. Then we put our men on the time rolls at the same rates we were paying here. This was a great gain to the Government, for at Madison and Des Moines, having taken our men from here, and paying them the wages agreed upon here before starting, we secured their work for $3, $2 50, or $2 a day, while out there we could not have got roofers under $5 50 or $6 per day.

Q. Did the Government pay them from the time they left here?—A. Yes, sir.

Q. Who paid their expenses on the way?—A. They were paid by the Government; we charged their expenses to the Government, and the amount was refunded to us.

Q. Was your own time charged in connection with the matter?—A. The superintendent's time was charged.

Q. Was this 15 per cent. charged not only upon the material used, and the work of the men, but upon their railroad fare, traveling expenses, &c.?—A. Yes, sir.

Q. Where was the material taken from?—A. Right from headquarters—New York.

Q. Can it be purchased cheaper there, taking freight into consideration, than at Chicago, for such places as Madison and Des Moines?—A. Yes, sir. The lead purchased for such places was purchased at St. Louis.

Q. What is this 15 per cent. paid you for?—A. Why, that is our profit on the work.

Q. If you had a job of work to do in Washington for the Government, would you not charge your regular prices?—A. No, sir, we would not charge our regular prices; we would charge regular cost prices.

Q. What do you mean by cost prices?—A. Only what we ourselves pay out. Suppose we had work to do for private parties here in town; we never would do plumbing work for a less profit than 33⅓ per cent.

Q. You mean you make that profit in addition to what you pay for material and for men? —A. Yes, sir; for instance if we pay $4 a day, we charge at the rate of $6 a day.

By Mr. PHELPS:

Q. Why would you add 33⅓ per cent. in case you were doing work for private individuals? —A. Just as a merchant adds 33⅓ per cent. to the cost of his sugar, coffee and other articles, in order to cover the expenses of rent, &c., as well as secure some profit for himself. In this instance, in the case of the Government, we charged less, because the amount of work we were doing was larger, and we thought we could afford to do it at a smaller per cent. of profit.

By the CHAIRMAN:

Q. This 15 per cent. covers also the guarantee for ten years?—A. Yes, sir; it covers everything.

Q. Has this patent roofing been used by you, to any great extent, outside of the work done for the Government?—A. It has been in use only the past year, but it has been used outside of the Government buildings; I have used it on some of my own buildings; I have used the pipe considerably.

Q. In work for private individuals?—A. No; for myself.

Q. Do you know of any cases in which these patents have, either of them, been used by the company for private individuals, or the right to use them sold to private individuals? —A. Well, I don't think they have been used by any private individual except myself; one principal reason is, I have not had the time, out of my own regular business, to make arrangements to carry on the thing

Q. When was this company formed?—A. Some time, I think, in July of last year.

Q. When were the patents obtained?—A. The year prior to that; they are now of about a year's standing; I do not recollect the exact date; I have the papers that will tell.

Q. Have you fixed any prices for the sale of this roofing, or for its use by private individuals?—A. No, sir.

Q. You have made no contracts whatever?—A. I have done a good deal of work myself where these pipes were used, and have charged into the price of the work enough to cover the use of the patent.

Q. What price have you charged for the use of the patent?—A. It would be difficult to get at that as a separate thing; I have generally put on to the work a charge of 50 per cent., when, if it had not been for the use of that patent, I should not have charged so high a per cent.

Q. That 50 per cent., I understand you, covers both your profit and the net cost of the work, and the use of the patent?—A. Yes, sir.

Q. Have you done any work under these patents for private parties in New York?— A. No, sir; we are in treaty for roofing that big building of Vanderbilt's.

Q. What are your terms with regard to that?—A. They are not settled definitely; the parties have been spoken to, and they appeared to think favorably of it.

Q. Is not 10 cents a square foot a large price for the use of so simple and cheaply applied a method as this patent covers?—A. I think not, when you take into consideration the fact that we warrant the roofing for ten years. I venture to assert that the Interior Department and Post Office cost the Government 50 cents a square foot just for repairs, and I believe the books will show it; I know that solder has been put on those buildings by the hundred pounds, and that men are kept at work upon them almost constantly. I believe this roof of ours, if there is any fair show given it at all, will be adopted. Copper roofs are very expensive, and cannot be put only upon expensive buildings: the copper itself costs, on an average, 30 to 40 cents a pound; that is a very heavy item of itself. It is the most durable roof, two to one, that can be put on to a building. The President's house is covered with copper; but I guarantee that the cost of repairs for it has been four times the cost of the original roofing.

Q. What is the weight of the copper that is used by this company in roofing?—A. Fourteen ounces for the sheeting or flat surface, generally; the other from 16 to 22.

Q. The royalty then adds about 25 per cent. to the cost of the copper?—A. Well, I do not know——

Q. What is the present price of sheet copper?—A. Thirty-one cents, I think.

Q. Then allowing 14 ounces of copper to the square foot, your charge of 10 cents a foot makes your royalty more than 33 per cent.

By Mr. ELA:

Q. At what time did you make this purchase of the Vaux patent—before you had this talk with the Secretary of the Treasury, or afterward?—A. I had no talk at all with the Secretary of the Treasury. I merely submitted a proposition to him.

Q. Was that proposition submitted to him before or after your purchase?—A. Long after: I purchased the patent a year ago last April, I think, and the proposition was submitted last June or July—two or three months afterward.

Q. Was there any understanding at the time of purchasing this patent, that it should be used on Government buildings?—A. No, sir; it had been used, and I supposed that they would follow it up, as they seemed to be well satisfied with it.

Q. You stated that you paid Mr. Mullett $6,000 for his interest; did that pay come in the shape of a house trade, or was it a direct cash purchase?—A. Well, the way of that was this: I paid him by my note secured upon the house—the house in which Mr. Mullett lives; and he took the house. In speaking about that ten cents per square foot, it should be understood that that is not 10 cents per square foot of copper, but 10 cents per square foot on the roof after the copper is put on, and the copper being curved, or corrugated, as it is, of course it takes more than a square foot of copper to cover a square foot of the roof. Besides, that covers our guarantee for ten years.

Q. Is there any roofing of copper on any principle that would not last ten years without repair?—A. Yes, sir; there is not a roof in Washington that has lasted three years without repair.

Mr. ELA. Why, I have a tin roof that has lasted since 1849.

Mr. PHELPS. According to that, copper is not as good as ordinary pine shingles.

The CHAIRMAN. Is this the only contract between your company and the Department?

WITNESS. Yes, sir.

The proposition of William S. Carr & Co. to A. B. Mullett, Esq., superintending architect of the Treasury Department, was here introduced in evidence as follows:

"OFFICE OF WILLIAM S. CARR & CO.,
"110 *Center Street, New York, July* 19, 1869.

"DEAR SIR: In reply to your favor of the 16th instant, we have to say, that in view of the fact that a large proportion of the roofing and plumbing in your Department is of the kind known as jobbing and repairing, it seems to us that the fairest proposal for both parties is to name a certain percentage of profit over and above the actual cost of material and labor, which should include all charges for patent-rights, royalties, &c.

"As a proposition, we submit that we will undertake such work in the roofing and plumbing as you may give us, apply the Vaux-patent principle to both branches, keep and submit an accurate detailed and sworn statement, if required, of the net actual cost, charging thereon a percentage of 25 per cent., which shall include all charges for royalties, patent-rights, &c. Or, if you prefer, we will name a royalty of 10 cents per lineal foot on the patent casing tubes which may be used in your Department, and charge a percentage of 18 per cent. on the actual cost of plumbing material and labor needed in repairs and work. We believe that either of the above propositions is fair to both parties. We wish to do good work and make a living profit, and we feel assured that the experience of all who have had to do with plumbing and plumbers is, to allow a fair profit and get good work.

"Very respectfully, yours,

"WM. S. CARR & CO.,
"*Per S.*

"A. B. MULLETT, Esq.,
"*Supervising Architect.*"

The CHAIRMAN. I see nothing in this contract about warranting the work for ten years.

WITNESS. I thought there was—I know that was the understanding. If it is not there, it must have been stated in the orders since. There is an indorsement on the back of that; let me see what that is.

The indorsement was as follows:

"Approved on a percentage of 15 per cent., and a royalty (on pipe and roof) specified.

"WM. A. RICHARDSON,
"*Acting Secretary.*

"SEPTEMBER 4, 1869."

"The proposed reduction of 15 per cent. is accepted.

"WM. S. CARR & CO.

"SEPTEMBER 4, 1869."

By Mr. ELA:

Q. Did you have any opposition in any way in regard to this plumbing about the Treasury Department—any biddings?—A. Oh yes, sir; that work was furnished by a dozen different parties.

Q. I understood you to say that you got the contract?—A. No, sir; we did only such work as they saw fit to give us. There has been ten times the work done that we have done.

By the CHAIRMAN:

Q. I see here a specification of a royalty of 10 cents per lineal foot on the pipe, but nothing about any royalty on the roofing?—A. I thought there was; it was intended to apply to that, certainly.

Q. Can you state what you have received from the Government during the past year?—A. I do not recollect the amount; it can be gathered from these papers I have brought.

Q. Please examine them, and give the committee the items and the aggregate.—A. I find that the Government has paid the following amounts as royalty for the use of our patent roofing and anti-freezing pipes on the following buildings:

Marine hospital, Portland, Maine, royalty on roofing	$915 80
Court-house and post office, Portland, Maine, royalty on roofing	245 50
Same building, royalty on pipe	64 00
Custom-house, Portland, Maine, royalty on roofing	181 10
Same building, royalty on pipe	93 60
Custom-house, Portsmouth, New Hampshire, royalty on roofing	675 00
Custom-house and post office, New Haven, Connecticut, royalty on roofing	672 60
Same building, royalty on pipe	28 80
Custom-house and post office, Richmond, Virginia, royalty on roofing	865 00
Same building, royalty on pipe	112 20
Court-house, Madison, Wisconsin, royalty on roofing	722 30
Custom-house, Cairo, Illinois, royalty on roofing	270 95
Court-house and post office, Des Moines, Iowa, royalty on roofing	758 80
Total	5,615 65

By Mr. ELA:

Q. In charging these things against the Government, as I see you do in these vouchers, do you charge just the same price you would to private individuals?—A. Oh no, sir; we charge the net cost price of the material to us.

Q. How do you go to work to make up the net cost to you?—A. Why, we keep an account of what we have to pay for material, and we charge the Government the same.

By the CHAIRMAN:

Q. But where you are carrying a large amount of these things, do you charge nothing as interest on the money invested?—A. Yes, sir; of course. In such cases we have to charge enough to cover interest on the outlay.

Q. Is that all you include?—A. Yes, sir.

Q. Nothing for rents, or anything of that kind?—A. Oh yes; we may put on a little for rents and the cost of our tools, and some little expenses of that kind.

Q. I see that in the case of the Des Moines court-house you charge the Government with 2,490 pounds of copper, at 40 cents per pound. I see that the price in Boston and Philadelphia is 30 cents. By what calculation did you make the price of that copper up to 40 cents per pound?—A. Copper has greatly depressed in value since that was bought. That copper cost us in New York 37 or 38 cents. I put on 2 cents per pound to cover the cost of transportation and other contingencies; but I do not believe it did cover them.

By Mr. ELA:

Q. I see that a good many things are set down as purchased at the places where these buildings are going up; it appears that you do not take from your headquarters here, or in

New York, all the things you want.—A. No, sir; there are lots of little things that cannot be provided for beforehand.

Q. Taking into consideration the expense of freight, rent of store-room, tools, &c., how large a percentage do you add to the original cost to you, to constitute what you call the net cost to the Government?—A. From 5 to 7½ per cent.

Q. Then you consider 7½ per cent. a good allowance to cover everything of that kind?—A. Yes, sir. That copper that you spoke of in connection with the Des Moines building—when that was needed the Government was out of money; so I bought it. and carried $15,000 or $20,000 worth of copper for five or six months. I had to pay interest on that money from the time I purchased the copper. Again, I shipped some copper to Mobile; a fire took place, and five or six cases of copper were destroyed. That ate up all the profits on that job.

By the CHAIRMAN:

Q. In this Des Moines bill, I see that the railroad fares of the workmen constitute 50 per cent. of their entire time roll; could not workmen have been procured at Chicago or in Iowa at rates that would have come to less than that, upon the whole?—A. We tried that, sir; and we found we could save $200 or $300 on the job by taking our workmen from here. The wages here were from $2 to $3 50 per day, at the outside; at Chicago we could not get men at $5 or $5 50 per day. Labor is very high out there.

Q. I see by this that you paid these men, some of them, $4 or $4 50, in some cases $5.—A. Only one man $5. I believe you will find that if the Goverument had attempted to do that work itself, it would have had to pay twice the money.

Mr. ELA. I guess if you had been doing that work for yourself you would have hired men at Chicago or Des Moines.

WITNESS. No, sir; we could not have done it. We offered $5 a day at Chicago.

By the CHAIRMAN:

Q. What price did you pay your superintendent?—A. Our foreman, his name was Clatworthy, was put down at $6 50 per day; we pay him a salary of $2,000 per year. Thomas M. Shepherd superintended the job; he is my brother.

Q. I see he was paid under two heads; his name is down on the pay-roll, and then there is a separate charge for him as superintendent.—A. The charge for him as superintendent refers, as you will see, to the time before the work was commenced; after the work was commenced, his name was put down on the pay-roll, and he ceased to receive pay in the other capacity. He was not paid twice for the same work, I can assure you that.

Q. Has Mr. Mullett now any interest in this patent?—A. No, sir; none whatever; and has not had since I purchased him out.

Q. Was there any understanding or suggestion that he would receive anything in return for giving you this work to do?—A. No, sir; I know him too well to make any suggestion of that kind to him, if I were inclined to do so. He has not received one particle of benefit from it, in any shape, directly or indirectly, since I purchased him out. That was an express stipulation at the time. In reference to the portion of the patent which I bought of Mr. Mullett, I think I said at the commencement of my examination that he owned about one-half of the patent. I think that Mr. Mullett had about $\frac{1}{32}$ of the patent.

Q. What was the whole patent valued at?—A. I think that Brown paid Vaux for his share $3,000, and he owned $\frac{4}{32}$ or $\frac{6}{32}$, I forget which; I think it was a little over a quarter.

Q. Was not the patent estimated by the corporation, when formed, at some fixed price?—A. Yes, sir; it was valued at $32,000.

Q. That was the nominal price at which it was capitalized?—A. Yes, sir; thirty-two shares of $1,000 each.

WASHINGTON, D. C., *June* 18, 1870.

ELLIS SPEAR sworn and examined.

By the CHAIRMAN:

Question. What position do you hold?—Answer. I am a primary examiner in the class of railway and civil engineering of the Patent Office.

Q. How long have you held that position?—A. Since August 1868.

Q. Was a patent obtained some time since in the Patent Office by Mr. E. P. Vaux for a method of metallic roofing?—A. Yes, sir.

Q. When was that?—A. My knowledge of it is based on the record only. I can tell from the file. I find from the record I have with me it was June 30, 1868.

Q. Have you the papers from the Patent Office, connected with the granting of the patent?—A. I have the original specification, and the correspondence, and the amendments to the original drawing.

Q. Please explain that to the committee.—A. This application was made March 25, 1868. I can best explain to the committee by reading what is stated to be the nature of the invention.

Witness read as foliows: "The nature of my invention consists in covering roofs either

of timber or iron frames with thin metal plates which are corrugated for the purpose of counteracting the effects of expansion and contraction, which, when not provided for, invariably destroy the continuity of the covering material."

That is the manner in which the inventor states the nature of his invention. This application was rejected by the primary examiner, my predecessor, twice; a second rejection being a final rejection before the primary examiner. The case was then appealed to the board. The grounds of the decision of the primary examiner, as shown in these records, were: first, that it was anticipated by references given in the office, the anticipation consisting in devices which show provision for a lateral expansion, and which are so constructed and arranged that longitudinal expansion was provided for already; and secondly, that expansion having been provided for by corrugations, there was no invention in simply putting in more corrugations, so that expansion could be provided for in all directions. That was the ground of the action. It went to the board twice, and the proceedings were not exactly regular. They were all proper; but the Commissioner allowed the case to go back once or twice. The board finally allowed the applicant to amend, and upon that amendment they allowed the case. The amendment was simply an amendment of the claim which I have given, and which is appended to the specification for the purpose of pointing out distinctly in the drawing what the invention consists of. In this case the invention was pointed out in the preamble, and also stated in the claim. I will read the claim as it was allowed by the board: "A corrugated metal roof that will allow expansion and contraction in all directions, when the same is constructed and arranged substantially as herein described." That claim was allowed by the board, and that is the patent. That is the invention, as stated by the specification.

Q. Please show the ways in which this invention may be carried out.—A. [Witness proceeded at length to point out to the committee, by reference to diagrams and figures, the way in which the inventor applied his invention, and the method of its application.]

By Mr. ELA:

Q. Is not the principle the same as that which is applied on the roof of the Capitol?—A. Yes, sir.

By the CHAIRMAN:

Q. Is there any thing more of the description of the patent which you desire to present?—A. I might say in regard to this claim, what I stated before, that as the office now rules, and as the present Commissioner holds, this claim would cover not only this specific device, which he shows, but any construction of roof which provides for expansion both ways; the terms of the claim being "A corrugated metal roof that will allow of contraction and expansion in all directions." The other clauses refer to other specifications. What was refused by the primary examiner was allowed by the board. There was a difference among the examiners in regard to the scope of the claims. When a claim read as follows, "when the same is constructed substantially as herein described," it was held by some that that would limit it to the exact thing shown and described; but the Commissioner holds and the courts hold that that does not strictly limit to the thing shown, but that it includes anything in substance like it.

By Mr. ELA:

Q. Would a thing be patentable that had been in use by the public ten years?—A. No, sir; it would not be if it were known at the office.

Q. Being granted, would it be of any avail?—A. No, sir; if it were shown that it was invented by somebody else, the courts would not sustain the patent. That is the law and the practice.

Q. This being the same principle as has been in common use, and the same exactly as that on this Capitol, there can be no patent for the corrugation?—A. No, sir; that is admitted in these papers. What he claims is the construction and arrangement of the roof by corrugations so as to permit of expansion and contraction in all directions.

Q. Has your observation shown you any instance of a corrugated roof so constructed as to permit expansion in all directions, before this patent?—A. Yes, sir. I can show the committee references given in this case which I think do it.

[Witness, by permission of the committee, proceeded to point out from a drawing in his possession, how the principle was applied in a case rejected in 1860.]

Q. Have you that principle of giving room for expansion and contraction in all directions, in your office, before this case?—A. I should say, so far as I know, we have no instance in which any corrugation is drawn at right angles so as to allow contraction or expansion both ways. We have not both horizontal and vertical contraction provided for by corrugation both ways.

Q. Does that really provide for expansion in all directions, when you leave the whole strain to come upon that small space where there is no corrugation? [Referring to a case represented in the figure shown.]—A. There is a corrugation across the whole length. In order to set myself right and the office, I wish to be understood that I do not say that we have any case precisely like this, where the corrugations run up and down and also across. The ground taken by the examiner was that corrugations being made one way and providing

for expansion one way, it was not a thing to be patented simply to provide for expansion another way.

By Mr. GRISWOLD:

Q. Is it not a principle to try to cover everything claimed in the description?—A. We are careful that one party does not infringe upon another; but when the question is simply as to the utility of the matter, whether it be of value or not, we leave the man to find out by trial. If the party claims and shows an essential difference that does not interfere with anybody else, we allow the claim, even if it be the private judgment of the examiner that it is of no value. But if it interferes with any other which shows substantially the same thing, we refuse it.

Q. Did you have the charge of the issuing of this patent?—A. I did not; it was done by my predecessor.

By the CHAIRMAN:

Q. How long was this application pending?—A. I cannot tell you exactly. It was filed March 25, 1868, and was ordered to issue June 30, 1868. The examiner filed the order to issue then. Mr. B. F. James was the examiner. In the mean time there were two examinations by the board. The Commissioner allowed it to go back for the purpose of making some changes in the claim. I find, on looking at the indorsement, that it was patented June 30.

WASHINGTON, D. C, *June* 18, 1870.

THOMAS C. CONNOLLY sworn and examined.

By the CHAIRMAN:

Question. What position do you hold in connection with the Government?—Answer. I am a principal examiner in the Patent Office.

Q. Did Mr. E. P. Vaux make application to the Patent Office for a patent for an improvement in tubing; and if so, when?—A. Mr. Vaux applied for a patent for an improvement in protecting pipes from freezing, on the 14th of September, 1867.

Q. Have you the claim on which he made his first application?—A. Yes, sir. The application I speak of now was rejected, but I have with me the specifications, including the claim.

Q. Are these original papers from the Patent Office?—A. Yes, sir.

Q. You may read the paper, if you please.

[Witness read the paper referred to, of which the following is a copy:]

"*To whom it may concern:*

"Be it known that I, E. P. Vaux, of the city of Washington, District of Columbia, United States, have invented a new and improved mode of protecting pipes or vessels or their contents from freezing; and I do hereby declare that the following is a full and exact description thereof, reference being had to the accompanying drawing, and to the letters of reference marked thereon.

"The invention consists in the application of an air-tight covering, isolated by a body of air, to the pipe or article to be protected, the inclosed air acting as a non-conductor. The accompanying drawing shows its application to a water or other pipe.

"Figure 1 shows the exterior of a pipe protected as above described, *a* being the pipe, *b* the exterior covering or outer pipe, *c* the caps connecting the pipes and forming an air-tight, non-conducting chamber.

"Fig. 2 shows a longitudinal section of the same, exhibiting the non-conducting chamber and the mode of connection.

"Fig. 3 shows the end of the connected pipes.

"Fig. 4 shows a transverse section through pipes and cap. It is obvious, however, that the connection may be made by any other method that would hermetically seal the outer covering.

"What I claim as my invention and desire to secure by letters patent, is the protection of pipes or vessels and their contents from the action of frost, substantially in the manner described.

"E. P. VAUX."

Q. What was your decision upon that application?—A. It was expressed in a short letter which I will read, with the permission of the committee:

"A rejection is hereby declared. Preserving the temperature of pipes and other vessels and their contents by means of external air chambers, or air jackets, has long been patent to the public. Double windows in houses are made on this principle; ice-houses and fruit-houses are so constructed. To encase any pipe in metal or in wood (a better non-conductor than metal) is everywhere a familiar domestic expedient. There are few modern houses of any magnitude in New York, or in any other northern city, in which this principle is not observed with respect to water and gas pipes. Ice-water pitchers are generally cylinders surrounded with hermetically sealed air chambers. The pipes of steam engines have long

been so incased. (See Bonner's Treatise on the Steam Engine; London, 1847; p. 11, Fig. 11.)

"T. C. CONNOLLY,
"*Examiner.*"

Q. What further was done?—A. When that letter was received by Mr. Vaux, he came to the Patent Office and expostulated with me in regard to the rejection, as he believed that he had an invention that ought to be patented. I insisted that he had nothing "new and useful," in the language of the patent law. He seemed very much disconcerted, and asked my advice, and I gave him my advice as I always do, if I find a man is lacking in a knowledge of the patent laws. I had considerable discussion with him, and he went away very clear in the idea that what I had suggested was true; and after a few days, on the 23d of September, he brought it back and made his application in a new and amended form, thus relinquishing the form which lies in the archives of the office as a rejected case, and proceeded with his new application. He next presented an external tube and an internal one, or an internal tube as continuous. The external tube would be continuous also, but that he chose to put disks around the inner tube; and by a kind of striking apparatus he determined to strike the disks so as to converge outward, by a kind of swedging process, so as to prevent air or water passing beyond that point, and thus this inner tube would be protected, and that was the fundamental idea of his invention. He explained that idea, and the means of applying it in his application. There were some little things which were incidental and useful, and were claimed in connection with it. I have reviewed this patent since I have been subpœnaed, and have written out what I understand the claim to be. This I will read, if you please.

Witness read the paper referred to, as follows:

"The first clause of the claim is for 'a pipe constructed and arranged for the transmission of fluids, having a hermetically sealed air chamber surrounding it, substantially as described.' That is to say, the interior pipe must be continuous, and the exterior broken in its continuity at suitable points, so as to form many separate air chambers, in order that a fracture in the external pipe shall not injuriously affect the interior pipe for any extended distance.

"The second clause claims, in combination with the foregoing, the 'intermediate braces, whether consisting of discs or other radial supports, or supports of horizontal pipes, substantially as described.' This is but reciting additional elements to the combination claimed in the first clause, the 'discs' being in fact repeated; 'or supports of horizontal pipes' appear to be meaningless words, or mere surplusage.

"The third clause is for the concentric pipes, the exterior of which may, however, be of other than cylindrical form, as shown in Figure 8, 'when united at its [their] curves or angles, substantially as described.' This is for the same invention already claimed, with an added characteristic described in the specification, on page 5, lines 22 to 25 inclusive, that is to say, that where elbows or bends occur the pipes may be joined in certain ways.

"It will thus be seen that, if the subject-matter of the first clause is 'new and useful,' the subsequent clauses must necessarily be valid; and that, though the first clause were not 'new and useful,' one or both of the subsequent clauses might be patentable by reason of the increased number of the elements comprehended in the combination."

Q. What was your report upon this second application?—A. It was simply the act of granting the patent. I indorsed my name September 23, 1867. That is the decision of the Patent Office, allowing the patent.

Q. Was the patent immediately granted upon that favorable report?—A. Yes, sir; it is dated October 15; my action was September 23; that is a very little more than the time usually given for recording the patents issued.

Q. There was no delay in securing the patent, except for that?—A. None whatever.

Q. And after the rejection of the first patent and the preparation of the papers for the new one, was there any?—A. None at all.

Q. Was there any expense involved so far as you have any knowledge?—A. None but the two fees marked on the bill; $35 in all, to the Patent Office.

By Mr. GRISWOLD:

Q. Will you please explain more fully the advantage of the spaces between the two tubes, being divided into two separate chambers?—A. That is the invention indeed. The interior tube is for the water which passes along through that by its momentum. Then there is an exterior tube. When these are above ground the water will freeze in the interior tube sometimes. If there is a leak or the water enters between the tubes it will freeze, and there being no interruption may freeze throughout it entire length. These discs are so made that they not only constitute air chambers, but afford firm supports and keep the tubes equally distant from each other, and they are stricken up in such a manner that water or cold air does not pass these points. If an accident occurs or a fracture is made, it can only extend so as to injuriously affect the inner tube for the short distance where it occurs, instead of throughout its length. And if there are repairs to be made, it will be only for that short distance, and the influence of the water or cold air will extend only for that distance.

By the CHAIRMAN:

Q. The only thing patented is the method of keeping open the space between the outer and inner tube, and the contrivances for producing that result?—A. Yes, sir. When you once invent anything everything which may be accessory to it may be claimed. But if the first fundamental idea fails, they go with it.

The witness, by permission, then went on to state as follows: The suppression of a truth is about as bad as the telling of a falsehood. Mr. Vaux, when he first failed, his temper was up. He thought it very absurd to have it rejected. He was honest about it; he knew he had a good thing. I said, you must get one of these professional men and do your best. I think he said he was in the employ of Mr. Mullett; he spoke of Mr. Mullett at any rate. I told him Mr. Mullett has been my friend and my neighbor; his family and my family were friends, and if he will advise you he will advise you for the best. The consequence was, Mr. Mullett was to see me; he was equally indignant with himself. I questioned Mr. Mullett and found he did not know what the invention was; and finally I convinced him I had done right. He said the man was ingenious, and if I could help him he would be obliged to me. I wish to state this, because if I should go away without doing so, I should not be as full a witness as I ought to be.

WASHINGTON, D. C., *June* 8, 1870.

BARTHOLOMEW OERTLY, sworn and examined.

By the CHAIRMAN:

Question. Where do you reside?—Answer. Now in Georgetown, D. C., though I am very rarely home now.

Q. What is your occupation?—A. I am by profession an engineer and architect.

Q. How long have you followed that profession?—A. Ever since my college time, about twenty-four years.

Q. Have you held any position in the Treasury Department, and if so, how long?—A. I have, for thirteen years.

Q. What position?—A. First computer and sworn measurer, and finally assistant architect.

Q. When were you appointed assistant architect?—A. In 1865.

Q. When did you cease to be architect?—A. In 1868.

Q. Who was the supervising architect during the time you held your position as assistant architect?—A. The first year Isaiah Rogers; afterward Mr. Mullett.

Q. Was there a cabinet shop connected with the Treasury Department under the supervision of the supervising architect during the time you were assistant superintendent?—A. There was.

Q. Do you know, while you were assistant supervising architect, of any furniture having been made at that cabinet shop for parties other than the Treasury Department?—A. Yes, sir.

Q. State what parties?—A. I do not remember many; you will find it all on the records of the Department.

Q. Where; that is, upon what books and in what shape?—A. Where such work was done for outside parties a charge of the work was made, and the sum was generally refunded; whether it was all finally refunded or not I do not know; the records will show.

Q. That is, the furniture was made and charged upon the books against the parties for whom it was made, and in some cases it was paid for?—A. Yes, sir; at least in my time.

Q. Give the names, if you please, of any such parties whom you can remember?

Mr. ELA. Would it not be better to refer to the books?

By the CHAIRMAN:

Q. Where are the books?—A. In the supervising architect's office.

Q. In what year was that furniture made?—A. I only know about what was made while I was there, from 1865 to 1868.

Q. Upon whose order was this furniture made?—A. Members and Senators used to go up there and admire the furniture, and desire some similar made for their use.

Q. And so ordered it?—A. Yes, sir.

Q. Were such orders approved by the Secretary?—A. I do not know whether they were or not; all I know is the furniture was made.

Q State the persons for whom the furniture was made?—A. I remember a desk for Senator Pomeroy, and one for Senator Sumner, and some desks for Secretary McCulloch.

Q. For his room in the Treasury Department or his house?—A. For his house. There were others, but I do not recollect their names now.

By Mr. ELA:

Q. Does the system of keeping books at the Treasury office show for whom the furniture was made, its cost, whether it was paid for or not, &c.?—A. Yes, sir.

Q. Who had charge of the books in which those entries are made?—A. I think Mr. Carr

had at that time. The daily reports will show the same thing; the daily reports made by the mechanics themselves.

Q. Who was superintendent of the shop when this work was being done?—A. Mr. Suter.

Q. Is the same person now in charge of the cabinet shop?—A. I suppose he is; I do not know.

Q. Is Mr. Carr now connected with the office of the supervising architect?—A. I do not know; I have not seen him for some time. He was chief clerk of the office at the time.

Q. How was the price arrived at for which those articles were charged to these persons?—A. From these daily reports; they gave the time consumed in making the furniture, as well as the cost of the material.

Q. The amount of material and labor was footed up, and made the basis of the accounts; then the articles were charged to the parties at their first cost to the Government?—A. Yes, sir.

Q. Do you know anything about the procuring of looking-glasses for the new extension of the Treasury Department?— A. Yes, sir; but you will find all I know about that in the report of my evidence before the Committee on Post Offices and Post Roads.

By the CHAIRMAN:

Q. Do you know anything about the Vaux roofing patent? If so, state what you know in reference to it.—A. The Vaux roofing patent is a device against the deleterious effects of the contraction and expansion of metals by heat and cold; when used as material for the roofing of buildings the metal is put on the roof with a "curvation," to allow the contraction and expansion. That constitutes the main claim of the patent. It was invented by Mr. Vaux.

Q. The peculiarity of the patent, then, does not consist in the material employed, but in the shape in which the material is applied?—A. Yes, sir, in this device; it can be applied with any metal.

Q. Is there any special difficulty in applying that method to any kind of metallic roofing?—A. Not to my knowledge.

Q. Do you know whether Mr. Mullett had, or has had, any interest in that patent?—A. I think Mr. Vaux assigned a portion of the patent to Mr. Mullett; what came afterward, I really do not know.

Q. How extensively has that roofing been employed on the Government buildings?—A. I am unable to say; the patent was issued two or three months before I left, so I cannot say how extensively it has been used on public buildings.

Q. Have you any knowledge of its being used on any public buildings?—A. I think it was used on the treasury extensions.

Q. Before or after the assignment of the interest in the patent to Mr. Mullett?—A. I think that was before the patent was issued.

Q. Do you know anything of the terms upon which the Government was permitted to use the patent upon the treasury extension?—A. I do not know.

By Mr. ELA:

Q. Was there any peculiar difficulty in putting that roofing on the building?—A. I do know that there was.

Q. State how it is laid; whether it requires any peculiar instruction.—A. No, sir; it is laid on in the usual manner in which copper roofing is laid on.

Q. It is laid on in that form? (bending a sheet of paper into a succession of curves.)—A. Yes, sir; there is a corrugation in each sheet. The guttering is made in the same way. There is really more merit in that than in the roofing.

Q. Now state to the committee about this anti-freezing pipe; what is it?—A. It is simply a pipe within a pipe, leaving between the two an air space.

Q. It is simply a 3-inch pipe with a 2-inch pipe inside of it?—A. Yes, sir; that is all.

Q. Is there any difficulty in arranging this sort of pipe any more than any other?—A. Not that I can see.

Q. In making your drawings for public buildings, after the first drawing, are the additional copies photographed?—A. Yes, sir; generally.

Q. When you make the drawing of any building, or of any part of a building, a section or floor, after making one drawing, you photograph the rest?—A. Yes, sir; unless only a few copies are required; if but few copies are required, it is better to have them traced by some draughtsman.

Q. How many copies are generally required?—A. Before the drawings are made a good many copies are required for distribution of the drawings to the bidders; after the contract is once made there is no need of so many copies; there is no need of more than four or five.

Q. Ordinarily, how many copies would be required for a public building?—A. Well, sir, before the Department employed a photographer, they used to print about 300—from 200 to 300 copies. We, then, of course, lithographed copies from the original drawings.

By Mr. CHURCHILL:

Q. That was for getting bids, I suppose?—A. Yes, sir. After that, three copies will answer

the purpose—one for the home office, one for the contractor, and one for the superintendent of the work. Making allowance for the waste of one or two, half a dozen would be all that legitimately could be needed.

Q. What was the expense of preparing those lithographic copies you speak of, compared with the expense of the photographic copies that are now employed?—A. That I could not say; I should suppose that, practically, the difference would not be very great.

Q. Do you know of any work having been done by the workmen employed in the carpenter shop connected with the Treasury Department, other than that done for the Treasury Department?—A. There were a few jobs done in the same way as those which were done in the cabinet shop.

Q. When?—A. About the same period.

Q. And charged in the same way to the persons for whom the work was done?—A. Yes, sir.

Q. Was that work ever paid for by the parties for whom it was done?—A. Yes, sir; I think the work done by the carpenter shop was mostly refunded.

Q. For whom was that work done?—A. Some of it was done for General Jeffries; some for other parties. But I would rather you would refer to the record for that; you will find it all there upon the books.

Q. It is there among the other accounts, is it?—A. No accounts were regularly opened with them; but the books will show the names and amounts.

Q. But we would like to get the names from you, as a guide to us; otherwise we would have to look all over the books.—A. I think Mr. Carr kept a book in which all of these transactions could be seen at a glance.

Q. Does this book contain all the work of this kind done, both at the cabinet shop and the carpenter shop?—A. I think all of it—whatever was done for private parties.

Q. What was that book called?—A. I do not remember.

Q. State the names of any persons who have had stone-work done, if you know of any?—A. Some was done for Prescott Smith.

Q. Where was the work done that was done for General Jeffries?—A. At his house.

Q. Where was his house situated?—A. On Fourteenth street.

Q. The workmen employed at the carpenter shop went to his house to do the work?—A. Yes, sir.

Q. Did he ever pay for it?—A. I think he refunded the amount, sir.

Q. In that case the labor was charged at what price?—A. At the price paid by the Government.

Q. And the materials, how?—A. At the price paid by the Government.

By Mr. ELA:

Q. You do not undertake to say that the Government run a cabinet shop and a carpenter shop for the benefit of private individuals?—A. I do not think the individuals made anything; the work was more expensive to them than it would have been if they had had it done by private parties.

Q. Where was that work done for Mr. Smith?—A. At an office building for him, as general agent of the railroad here; it was done in that office.

Q. Do you remember any other persons for whom work was done, than those you have named?—A. Work was done for others, but I cannot give the names of any others.

Q. Was the work that was done for private parties done at the shop?—A. Either at the shop or at their private residences.

Q. What knowledge have you of such work having been done for other parties?—A. I made it my business generally to examine the daily reports and see what work was done, and what it cost; but my memory is not good enough to enable me to give the names of the persons.

By Mr. CHURCHILL:

Q. Can you give the committee any idea of the amount of work that was done for private parties at the cabinet shop and the carpenter shop; the aggregate?—A. I could not state it definitely.

Q. What sum can you name as an approximation?—A. I should think at a minimum it would be quite likely $10,000 for work of this kind.

By Mr. ELA:

Q. I see here an allegation in regard to keeping a horse; was a horse kept at the expense of the Government?—A. Yes, sir.

Q. For what was it used?—A. At the time when the extension of the north wing was in operation, it was used for carrying orders; the superintendent and the supervising architect were repeatedly called to various parts of the city, and a horse was deemed necessary.

Q. Is a horse kept there now?—A. I cannot say how it is now.

Q. What use would there be for one now?—A. I do not know.

Q. Do you think that there was any necessity for a horse to carry orders, when the extension was going on?—A. Yes, sir, there was then a necessity for it.

By Mr. CHURCHILL:

Q. Do you know anything of the Philadelphia bonded warehouse—of the original plans or estimates, and the work which has been done upon the building?—A. I know about the plans from the first to the third floor; since it reached that point I have not seen the work nor the plans.

Q. Who prepared the plans for that work, originally?—A. They were prepared at the office.

Q. Did you have anything to do with their preparation or with the estimate?—A. I had a little to do with their preparation.

Q. What was the original estimate?—A. I think it was $178,000.

Q. That was for the entire building?—A. Yes, sir.

Q. What size did you calculate for?—A. One hundred and seventy by seventy-three feet.

Q. When was that work commenced?—A. In 1867.

Q. Upon the plans for which these estimates were made that you speak of?—A. Yes, sir.

Q. Has the work been carried on according to those plans?—A. It was, up to the time I left the Department; since then I have not seen the building.

Q. What amount had been expended on the building when you last saw it?—A. I cannot state, positively. There had been a good deal more expended than had been calculated upon, partly on account of the difficulties encountered in the foundation.

Q. Was the expense of the foundation more than had been estimated?—A. A good deal more.

Q. What caused that increased expense?—A. On one end of the lot was the old Pennsylvania Bank building; and the removal of the foundations of that building occasioned an extraordinary amount of trouble and expense.

Q. Was that time and trouble necessarily expended?—A. I think it was: those old foundations had to be removed.

Q. How much was that increased expense beyond the original estimates?—A. The increase of cost on account of that excavation I think quite likely was not less than about $15,000.

Q. In what time should the building have been completed upon the plans adopted?—A. It could have been built in eighteen months.

Q. What is the state of the building now; what stage of erection has it reached?—A. I do not know.

Q. How has that work been done: by contract or by days' work?—A. It had been carried on by days' work up to the time when I last saw it; the iron work had been done by various parties.

Q. Had any part of the cost of erecting the building exceeded the estimate, except that of the foundation?—A. The cost of the iron work, I think, had been rather less than the estimate; but the cost of the brick work a little higher. The difference was really not great. It is generally the contingent expenses that mount up so fearfully when buildings are erected by days' work—especially when the work is delayed by failure of appropriation or any other cause.

Q. You are not aware of any very great increase of expense except that arising from the unexpected expense of the foundation?—A. No, sir.

By Mr. ELA:

Q. From your experience as an architect what is a fair percentage on the cost of a large building, for plans, clerkship, and superintendence? I mean for such buildings as the Government is in the habit of putting up?—A. The schedule by which architects go would allow 3 per cent. for superintendence, plans, and specifications. It is usual to charge for small buildings 5 per cent.

Q. That would include draughting, clerkship, and the superintendence of the building?—A. Yes, sir.

By Mr. CHURCHILL:

Q. Do you know of the marine hospital building at Chicago—the original plans and estimates, and the expense of the work?—A. You will find all that in the report of the Committee on Post Offices and Post Roads. I have nothing to say beyond what I said there.

Q. If I recollect rightly your testimony was limited simply to the statement that the original estimate of $132,000 ought to have put up a sufficient building——A. That was the strict wording of the appropriation at the time; the wording was that in no event should the cost exceed——

Q. Did you make any estimates upon that building?—A. Yes, sir.

Q. What was the cost of the building that you estimated for?—A. $300,000.

Q. Why did you estimate for so large a building?—A. It was not for me to change the plans, but to calculate how much the plans placed before me would cost.

Q. Who had prepared the plans?—A. They were prepared in the office.

Q. By whom?—A. Under Mr. Mullett's direction.

Q. The plans which he had prepared being accepted, what would be the necessary ex-

pense of the building?—A. The building, if carried out according to those plans, would, when completed, cost $300,000.

Q. Would it cost that if the work was economically done according to those plans with the same material and in the same style?—A. Yes, sir.

Q. Do I understand you to intimate that a building might have been erected there, sufficient for the purposes intended, for $132,000—the sum at which the original site was sold?—A. That is a very different question. What kind of building is required is a very different question from the question whether you could put up a certain building for $132,000.

Q. Then you do not pretend to say that a building could be put up for $132,000 that would have answered the purposes of a marine hospital?—A. I do not want to say anything about it at all; the determination of that is not the province of an architect.

Q. The act of Congress did not limit the expenditure to any particular sum?—A. Yes, sir, it did; the act of Congress was very particular.

Q. Did the act require that the old marine hospital should be sold and a new one erected, but that the cost of the new building should not exceed the cost of the old, but without naming any sum?—A. Yes, sir.

Q. And, as a matter of fact, the old site sold for $132.000?—A. Yes, sir.

Q. Was not that a very considerably less sum than it had been supposed the old site would realize?—A. No, sir; the old site and building cost together $57,000, but the property had risen in value so as to be worth much more than the original cost.

Q. Was it not anticipated that it would sell for more than it did?—A. I do not know as to that.

Q. Those plans of which you spoke, to cost $300,000 or more—were they made before or after the sale of the old site?—A. After.

Q. And before or after any further action was taken by Congress on the subject?—A. Before.

Q. Was it known what sum had been realized for the old building when these plans were prepared?—A. It was known.

Q. Was any effort made to prepare plans, the expense of which would be within the sum which had been realized by the sale of the old building?—A. No, sir.

Q. Why was not such an effort made?—A. It was considered that this sized building was needed. Mr. Mullett thought so, and the Secretary must have thought so, because he approved the plans.

Q. Then the plans which were prepared were prepared for such a building as it was supposed was necessary for a marine hospital at Chicago?—A. That was the case.

Q. Was any expenditure made upon the building until after the plans had been submitted to Congress, and a further appropriation asked for and obtained?—A. I don't think the plans ever were submitted to Congress.

Q. Were they ever submitted to any committee of Congress?—A. I do not know that they were, sir; I think only to the Secretary of the Treasury.

Q. Was not the attention of Congress called to the plans, and to the necessity of a larger expenditure than was provided for by the original act of Congress? Was not the attention of Congress called to it by the report of the Secretary before any money was expended on the new work?—A. Not that I know of, sir.

Q. Do you remember in what year the old site was sold?—A. In 1865.

Q. In what year was the work upon the new building commenced?—A. In 1867, I think.

Q. When was the site purchased for the new building?—A. In 1867.

Q. Do you know the price paid for the site of the new building?—A. I think $10,000.

Q. In what year were the plans for the new building prepared?—A. I think they were prepared, the first sketches, in 1866.

Q. And the estimates of expense?—A. The estimates, such as they were, showed that the expense would be not less than $300,000; but they were very rough estimates.

Q. By whose direction was this purchase made, and the work upon the new building commenced?—A. The purchase was made, of course, by the Secretary of the Treasury; Mr. Mullett, I think, negotiated for the land.

Q. Was the commencement of the erection made upon Mr. Mullett's order, or upon the order of the Secretary of the Treasury?—A. Upon Mr. Mullett's order.

Q. Independent of, or under the order of the Secretary of the Treasury?—A. After the plans are approved, there is hardly any need for a special order of the Secretary.

Q. When were the plans approved by the Secretary?—A. Early in 1867; before the purchase of the site.

Q. How soon was the erection commenced after the site had been purchased?—A. Some four months.

Q. How was that work carried on—by contract or by days' work?—A. By days' work.

Q. Entirely by days' work?—A. Yes, sir, at that time entirely so.

Q. Have you any means of comparing the expense, as it was by days' work, and what it would have been by contract, on that particular building?—A. I have not.

Q. Have you the means of making a comparison of the expense of work done by contract and days' work on any building of the Government, erected within the last five or six

years?—A. It is my opinion that the cost of doing such work by days' work is largely in excess of the cost of the same work done by responsible contractors.

Q. By what system of figuring do you arrive at that result?—A. To reduce it to figures is almost impossible.

Q. Upon what grounds do you base your objection to having work done by days' work?—A. There are several reasons. In the first place if you make a contract you assume a definite thing. To change it requires the assent of two parties; the result is a change cannot be made so readily as in the other case, where you have no other party checking your desire for changing, or objecting to it. This you will notice is quite a point; for the tendency of almost every architect is for constant changing, The very fact of a definite contract is a great check against this almost universal tendency of the profession.

Q. But with an architect who knows his mind from the beginning that objection would not exist?—A. You will find hardly one architect who is not given to changing his plans. This very fact of having a contractor whose interest it is to look to his bargain, is a good check on this tendency. Then if the Government does its work by days' work, you will find invariably three more foremen than are really needed. And furthermore, instead of pulling together, these men all pull against each other—a very serious drawback on any work. Again, if the Government attempts to do work by days' work, there are so many men who have a claim or insist that they have a claim on the Government for patronage; and in this way responsible places will be given to worthless men, and generally at higher prices than any contractor can afford to give. Again, the contractor has many means of obtaining his materials, and even his help, at cheaper rates than the Government possibly can. But it is very difficult, in fact impossible, to reduce these various drawbacks to figures. To be sure, you allow a contractor a certain margin for profits; but where there is fair competition among bidders, the profits are not generally so very great.

Q. Have you ever made any calculation as to the comparative cost of work done by contract, and by days' work?—A. I do not know that I have made any accurate calculation in connection with any particular building.

Q. What is your estimate of the difference?—A. It is very considerable; something like 50 per cent., I think.

Q. Who prepared the plans for the Madison court-house and post office?—A. They were prepared in the office under the supervision of Mr. Mullett.

Q. While you were in the office as assistant superintendent?—A. Yes, sir.

Q. Who made the estimates for that building?—A. I did.

Q. What were the original estimates?—A. I could not tell positively without referring to my books.

Q. What is the population of that town?—A. It was about 11,000 at that time.

Q. Do you remember the size of the building for which estimates were made?—A. It was very nearly the same as that at Springfield: I think 120 by 61 feet, but I will not be certain.

Q. What was the height?—A. Three stories and a basement.

Q. For what purposes were the different stories to be used?—A. The lower for a post office, the second for revenue offices and a land office, the third story for a court, I think. I believe a portion of the second story was also to be used for the court.

Q. How much had been done upon that building before you left the office of supervising architect?—A. I think the basement was built, and some stone-work was being cut—a very small amount, however.

Q. How did the work, so far as done, compare with the estimates which had been made?—A. I think it compared favorably with the estimates up to that time.

Q. That was being done by days' work, was it not?—A. Yes, sir.

Q. Do you know anything about the progress of the work since you left the office?—A. No, sir; I do not.

Q. Do you know of any matter in which, in your judgment, Mr. Mullett has failed to pursue the course which he believed would be for the advantage of the Government?—A. I have no doubt that his belief is that his system is the correct one; I never assumed anything else; he certainly acts on that belief.

Q. You differ with him in judgment; but have you ever seen anything which led you to believe that he was not pursuing a course that he deemed to be for the best advantage of the Government?—A. No, sir; I think he does what he thinks is for the advantage of the Government.

Q. In any of these matters, regarding the carpenter shop, the cabinet shop, &c., did you have any reason to suppose that he was intending that the persons for whom the work was done should have it without paying to the Government its full cost?—A. I could hardly suppose it, or he would not charge it to those parties; not only that, but the bills were actually sent them. If there was any lack, it was simply that the Government did not charge its 15 per cent.

By Mr. PHELPS:

Q. How did it happen that the Government went into that business?—A. Well, that is really hard to say.

Q. Were the hands idle?—A. No, sir; there was a sufficiency of work.

Q. Then I do not understand how the Government came to go into that business of doing cabinet work and carpenter work for these Senators and Representatives?—A. Well, I cannot tell; you had better inquire at these two houses here.

By Mr. ELA:

Q. From your experience as an architect, and from what you have seen of Government building, what would be the difference in the construction of public buildings, such as you have been talking about, under the superintendence of a good, efficient man, or of one who was inefficient? I mean by the days' work system?—A. Of course, under the days' work system, the difference can amount to quite a great deal. I have no doubt that, under an inefficient superintendent, the increased cost will be from 15 to 20 per cent.; perhaps more.

By Mr. MUSSEY:

Q. Are you sure you are correct in the dimensions which you gave of the Madison court-house?—A. I am not certain with regard to its dimensions.

Q. Are not the dimensions 115 by 60 feet?—A. I really do not recollect.

Q. In regard to the stone-cutters on Madison court-house, were they obtained on the spot, or sent for from the East?—A. That is more than I can tell.

Q. You were speaking of the contract system; do you know of any building, erected under the contract system by the Government, in which great changes were not made before they were completed?—A. Yes, sir.

Q. Mention one.—A. The Baltimore court-house was one. There was hardly any change made at all, until Mr. Rogers began to change it, and that change was trifling compared with the total amount of work. So long as I had superintendence of that work there was not a solitary change from the original plans.

Q. That is the only one that you think of, then?—A. There were several other cases where the changes amounted to very little.

Q. Do you know anything about the contractor on that building presenting a claim of $100,000 for extra work?—A. Yes, sir; but that was not relevant to the contract in itself.

Q. Was not that for extra work done on account of changes?—A. No, sir; it was simply from the fact that the building was erected during a period of war, instead of during a period of peace; it was not at all on account of changes.

Q. You spoke of the marine hospital building at Chicago; do you know how that sale was made—whether on time or for cash?—A. For cash.

[Mr. Mussey here explained that in the above case the purchaser was not to get possession of the property until a long time after the sale was made, and that, accordingly, the property sold for a great deal less than it would have done under ordinary circumstances. He read from the act of Congress authorizing the sale.]

Q. Did you assist in drawing up the report for Mr. Mullett, which report was finally laid before Congress, stating that a larger sum of money than $132,000 was required for the construction of a marine hospital at Chicago?

Mr. ELA. Is that material?

MR. MUSSEY. So far as it appears at present the work on the new building was not commenced until the attention of Congress was called to the fact that more money was wanted, and Mr. Oertly's testimony this morning seems to convey that idea, for he says that the old building was sold in 1865, and the new one commenced in 1867.

Mr. OERTLY. I do not remember that the attention of Congress was specially called to the fact.

Mr. MUSSEY. O, well, we will produce the report itself.

Q. I wish to ask whether, before work is commenced on any of these buildings, it has not been the custom of the Secretary to appoint a superintendent and a disbursing officer?—A. Yes, sir.

Q. That is the first step?—A. Yes, sir.

Q. And has not that designation be regarded as authorization to commence work?—A. Yes, sir.

Q. Do you know how long they were obliged to wait for the examination of the title to that property by the Attorney General?—A. I do not remember distinctly; I know that there was considerable delay.

Q. Do you know that a delay of four months was occasioned by that?—A. I do not know exactly how long the building was delayed on that account.

Q. In relation to the warehouse at Philadelphia, did I understand you to say that its dimensions were 170 by 73 feet?—A. As near as I can recollect.

Q. Please refresh your memory, and see whether you did not report the measurement in the first place 251 by 77 feet, which the office cut down to 247 feet in length by putting it 3 feet back from the street?—A. To give figures of buildings without referring to memoranda is a hard matter. I was under the impression that it was 170 feet long.

Q. When you made your estimates in regard to that building, did you not know that this old wall, old foundation, was there?—A. We knew it was there, but had not the slightest idea of the trouble and expense it would cost.

Q. And the expense of laying the foundation of the new buildings was owing to the difficulty in excavation on account of the foundation of the old building?—A. Yes, sir.

Q. Which had not been provided for in your estimate?—A. We did not provide for it in our estimate, because we could not foresee it.

Q. In regard to this furniture furnished to individuals, I think you said that $10,000 would be the minimum value; does that include the furniture and carpenter work both?—A. Yes, sir. The furniture alone would not reach that amount.

Q. Do you know whether Mr. Mullett was in favor of affording these facilities to private parties, or was it the action of the Secretary to a very considerable extent?—A. Quite likely both; but, as I said awhile ago, the proper place to inquire would be right here.

Q. You speak of a desk being made for Senator Pomeroy and one for Senator Sumner; do you know whether those were ever paid for or not?—A. I know that Senator Sumner paid for his; about Senator Pomeroy's I cannot say; he did not pay for it during my time. I know that the bill for it was presented to him.

Q. As to the work done for Mr. Smith, do you not know that the men who did that work were dropped from the Government pay-rolls, and were paid by Mr. Smith personally for that work?—A. I did not know it.

Q. You were speaking of the comparative cost of the photographic and lithographic processes of preparing duplicate drawings of plans; can you give, with any accuracy, a statement of the expense of the two processes?

Mr. ELA. It seems to me that is not at all material; the cost of lithographing or photographing is of no account any way.

Mr. MUSSEY. It was a part of the examination.

WITNESS. If you require a large number of copies, the lithographic process is cheaper; if the number of copies is limited, say a half dozen or fifty, photographing is cheaper. There may be a point, some certain number, where the cost would be just the same in both cases. You will find the cost of all the photographing and lithographing that has been done on the records, and can make your own comparisons. The photographic establishments do such an extensive business of every kind——

By Mr. ELA:

Q. What do you mean by business of every kind?—A. Taking views of public buildings, taking portraits, copying maps for the War Department, &c. They do a great deal more work and a great many other kinds of work than the mere copying of drawings.

By Mr. CHURCHILL:

Q. Have you any idea of the comparative cost of having this work done by a photographic establishment at the Treasury and getting it done at private establishments?—A. I could not give any opinion on that point.

By Mr. MUSSEY:

Q. Did you say that you do not know on what terms those roofs were put on?—A. I believe I did.

Q. Do you know what royalty was paid?—A. No royalty was paid in my time.

By Mr. ELA:

Q. Do you know the cost of slating per square foot?—A. That depends entirely on the kind of slate. If very heavy and thick it costs three times as much as ordinary slate.

Q. What is the cost of the slate like that upon the Treasury Building?—A. I do not recollect exactly; but I will furnish you the figures if you desire them.

The witness was requested to furnish them.

By Mr. CHURCHILL:

Q. What was the expense of the slating on the Treasury Building compared with that on ordinary buildings?—A. More than triple.

Q. Do you know how long a slate roof lasts in comparison with copper and iron?—A. If well selected I would prefer a slate roof to any kind of metallic roof, excepting lead.

Q. Do you deem lead better than copper?—A. Oh, yes, sir; but look at the expense. You could not use less than six-pound lead, while one-and-a-quarter-pound copper will answer all purposes. Lead roofs are known to have lasted a great length of time.

Q. How long will a copper roof last?—A. Well attended to?

Q. With such attention as is ordinarily given to the roofs of buildings.—A. About one hundred and fifty years, it is estimated.

Q. And a slate roof?—A. A well-selected slate roof is almost indestructible. It is the framework which gives out and destroys the roof.

Q. Do you know anything of a change in the approach to the south front of the Treasury Department?—A. No, sir, no more than any one would from observing it when passing by.

Q. Have you anything to say with regard to its architectural or ornamental value as compared with the former work?—A. I do not know that I have. It is merely a matter of taste. The former platform was a very good one; one of the most substantial and best

built jobs of the kind I have ever seen. I thought it was a pity to remove it. With regard to the appearance of the new work, that is entirely a matter of taste.

Q. Have you any criticism to make upon it at all?—A. Well, not upon the platform proper; the platform proper has a more pleasing appearance to-day than the one on the north has. But the defective point is in the south railing and gate-post. There is a perfect confusion of lines—perpendicular, horizontal, and slanting at every inclination—which detracts very much from the effect. But the balustrade, especially at this time of year, with its green backgrounds, has something pleasing to me. But I think the effect has been arrived at with unnecessary cost.

Q. Do you know what the cost has been?—A. No, sir.

WASHINGTON, D. C., *June* 18, 1870.

Mr. GEORGE C. RICE was duly sworn and examined.

By the CHAIRMAN:

Question. What official position do you hold?—Answer. General superintendent of the Treasury buildings.

Q. How long have you held that position?—A. Since the 17th of March, 1869.

A. Is there a patent lock which you have put on or used in any number in the Treasury Building within the last year?—A. Not that I have used. There is a patent lock, called the Johnson lock, used for the files of the Register's office, placed there by the Supervising Architect. They were on hand when I entered upon duty.

Q. Do you know whether Mr. Mullett now has, or ever had, any interest or ownership in the patent?—A. I do not.

Q. Have you any information on the subject?—A. Only what I got from the machinist, who said that Mr. Chambers went to him one day and asked him if he would examine two locks that were to be used by the Internal Revenue, and he told him he would if the committee sent for him. He went up and examined the lock, and he preferred another lock to this Johnson lock, which he considered valueless. The other lock—the tumbler lock—he considered the best that is manufactured.

Q. From whom does the Johnson lock take its name?—A. The Johnson Lock Company, New York.

Q. Do you know whose patent is used in the construction of the lock?—A. I could not say.

[Witness produced the key of the lock, saying it was the key of the lock used in his own office.]

Q. Have you any information of any directions being given by Mr. Mullett in regard to the use of this lock?—A. None at all; only that they were placed on the files of the Register's office.

Q. Was that done before or after you became superintendent of the building?—A. Afterward.

Q. What number were placed upon those files?—A. Something like three hundred or over.

Q. Have you any knowledge of the cost of this lock?—A. I understand the cost for the locks only, without the expense of placing them upon the cases, was something like $5 each. I am not confident of that; it is simply a hearsay.

Q. Are you a judge of locks yourself?—A. I do not pretend to be. I have seen a machinist take five steel wires and pick the lock by operating with his thumb and fingers, and turning the lock just as I would with the key. I do not know that I could do it; I never tried it. He is a good machinist, and understands locks. He has never had any difficulty in opening any lock on the cases there.

Q. Who were the men who put the locks on the files of the Register's office?—A. I did not know the men. I saw them at work, and knew they were working for Mr. Mullett at the time.

Q. Were there other locks of that pattern on hand besides those that were used?—A. Not exactly of that kind; they were of that patent—of the same principle precisely. They were the Johnson lock.

Q. What number of locks of that patent are in use about the Treasury building, so far as you are able to judge?—A. I think there are some 300 or 400 in Mr. McCartee's Bureau. They are placed in different parts of the building. I would not pretend to say how many in all. There were several locks on hand of that kind when I went into the office; and I afterward refused to purchase when they sent a requisition on me for General Spinner's Bureau.

Q. Who made that requisition upon you?—A. General Spinner. I refused to furnish them. Mr. Chambers (or Chamberlain, I am not confident about the name) came to me with the requisition, or with the messenger who had the requisition, and I told him the lock was worthless, and I would not have anything to do with it.

Q. Do you know how the requisition was brought about?—A. That I cannot tell; but I pay no attention to such requisitions.

Q. Do you know by whose influence these locks were procured, so far as they have been used about the building?—A. No, sir.

Q. Have you any information upon the subject at all?—A. Only what the machinist told me in relation to the matter at the time he examined the locks for the Internal Revenue.

Q. What was that?—A. He said that Mr. Chambers told him that Mr. Mullett was interested in the lock; how far, he did not pretend to say; but that Mr. Mullett had made an improvement on the lock, for which he received $1,000, and that he asked $2,000 for the improvement; but that he had settled another way, he did not say how, but leaving the impression upon the mind of the machinist that it was in the form of a royalty. That was what he told me; and he stated that he would be qualified to testify to that. He did not say that the agent stated positively that Mr. Mullett did have a royalty; but that he talked in such a manner as to leave that impression on his mind.

Q. Are there as many as 1,000 of these locks in different parts of the building?—A. I think so, as many as that of my own knowledge: and there are many places in the building where I do not go.

Q. Have you ever had any conversation with Mr. Mullett as to the value of this lock, or the advisability of its use?—A. No, sir; Mr. Mullett and I have not spoken with each other for some time. He has no particular fancy for me, and does not talk to me, and, of course, I do not talk to him.

Q. Does this Chambers, of whom you speak as the agent for introducing this lock, reside in Washington?—A. No, sir; I think he resides in New York. That was what he told me when he came with the order or requisition, which was the only time I ever saw him.

Q. He came, then, from General Spinner's office?—A. Yes, sir, or about that time; or at any rate I had the requisition before me when he came in. I would not say whether he came with the messenger or before. It was about six months ago.

Q. Have any of these locks been used in the Treasury building since that time?—A. None, only those on hand. Yes; there have been some in Mr. McCartee's Bureau since that time.

Q. Was that under your charge?—A. No, sir; it is under the charge of Mr. Mullett.

Q. Did you ever give your opinion to Mr. Mullett as to the virtue of the lock?—A. I have spoken of it generally, about the building, but not to Mr. Mullett personally. When this matter came up, of obtaining them for the files of the cases in the Register's office, I objected to it, because I thought there was no necessity; but that was a mere matter of opinion.

Q. Have you any control of the matter of procuring furniture for the rooms in the Treasury building, and if so, what?—A. In fact, all of it comes under my charge. The Secretary requires me to order the furniture with his consent, which I have to order through Mr. Mullett, for such things as are of much expense, like desks, cases, &c.; for ordinary furniture, like a washstand, I might go and apply for it; for anything valuable I am required to make my requisition on Mr. Mullett for it. I objected to allowing Mr. Mullett to dictate what kind of furniture was necessary just after I went there. I thought he was making the furniture too expensive for the Department, and I objected to it without his first giving me an estimate of the cost. I worked upon that until I received an order from the Secretary requiring Mr. Mullett to give an estimate for anything of importance. He did not think it necessary to give orders for small things, but when a fine thing was required then I wrote to Mr. Mullett to give an estimate; that has been done since the 16th of March last. Before that time I did not ask for an estimate. In some instances there have been a few desks which the Secretary authorized me to go outside and get, which I did.

Q. Have you any connection with the cabinet shop, except as you make a requisition upon Mr. Mullett for a particular article?—A. No, sir.

Q. Will you state how the cost of articles which were furnished you from the cabinet shop upon your requisition compared with the cost of similar articles which you purchased outside?—A. I should think there was a difference of somewhere in the neighborhood of 25 per cent. But that was not the great difference between us. If I went outside and got an article for temporary use, I was not very particular about the quality; but if I wanted something which was to be a permanent thing, I considered then that I had about 25 per cent. advantage in purchasing outside. But the reason why I objected to the furniture being made in that shop, under the old plan, was, that if I bought a piece of ordinary furniture, which would answer the purpose, I had no control over it. I had to take such a piece as the workmen would make. For instance, if I wanted a case which I thought should be worth only $200 or $300, they could make one worth as many thousand dollars. I did not care where it was manufactured; I only wanted to control the price.

Q. Then the only saving that you make since the 16th of March, compared with that before, is, not that you get the same quality of work cheaper, but that you get a cheaper article?—A. I consider that I gain about 25 per cent.

Q. Do you get an article of the same quality for that difference in price?—A. I do.

Q. You still continue to make your requisitions upon the shop?—A. I am compelled to do that, unless I get permission to go outside.

Q. You have a discretion as to the cost of the article?—A. Yes; I can either make a requisition for it or not, as I please.

Q. Are you obliged to get an order from the Secretary before you can purchase outside?—A. Yes, sir; I have to take an order. He generally gives me a verbal order. I generally

take the officer that wants the article to him, and the Secretary then authorizes me to go outside and purchase as I think best.

Q. Have you compared the articles in the Department, which have been made at the shops, with the articles of a similar character which have been made heretofore by contract with the Department, as to the workmanship, and as to the comparative cost?—A. I did this when the articles were made; and I have taken mechanics with me and showed them the furniture, and have taken the dimensions of the furniture and then asked an estimate upon a similar piece of work, when I wanted something made of a similar character; and they were to guarantee as good work.

Q. How would their estimates compare?—A. They were in the neighborhood of 25 per cent. less. Mr. Mullett admited to the Secretary, himself, that there was about that difference.

Q. When was that admission made?—A. I suppose it was eight or nine months since.

Q. In what respect was there any advantage to compensate for this loss?—A. The shop had to keep at work for other work; it was necessary to keep the men at work.

Q. For what other work was it necessary to keep the shop up?—A. For the permanent work about the building, with which I had nothing to do. They were finishing off the north wing, putting up bannisters, &c.; and then it would be constant work for the men instead of letting them go idle, and he thought there was no doubt the work would be all well done. He thought the same kind of work might be slighted by others.

Q. Is not the permanent work now completed and out of the way?—A. Yes, sir.

Q. What work is there now for the cabinet shop, with the exception of this furniture?—A. There are constantly some little repairs and alterations, changing the rooms for certain purposes, which would require a few mechanics.

Q. Are there not a good many articles of furniture, which are expensive, about the Treasury Department, made before you became superintendent there, and which you understand to have been made by contract with parties outside?—A. Yes, sir.

Q. Are not the articles which have been made at the cabinet shop connected with the Treasury Department, as a general thing, more substantial than those made by contract?—A. Yes, sir.

Q. As a matter of fact, have they not been quite as cheap as the prices you have learned were paid for others?—A. Yes, sir; I think so.

By Mr. ELA:

Q. Have you ever understood that those things made on contract were given out in favoritism?—A. That is common conversation in the Department. That is always the case, if a man happens to get a job.

By Mr. GRISWOLD:

Q. There are some articles manufactured outside which are not worth 25 per cent. more than those made inside?—A. Yes, sir; and there are some which I think are comparatively worthless. I have examined some of them, and I would not give 25 per cent. of the cost of them. There are some cases which are scarcely worth a quarter what was paid for them.

Q. That is no argument in favor of the Government's doing the work?—A. I do not care about the Government's doing the work; but I want to control the cost of it. If I think a low-priced article will do in place of a high-priced one, I want the liberty to get the cheaper one. One that cost $100 would be just as good, in some cases, as one that cost $500.

Q. Is it not true that you cannot go out and buy such an article as you need, for a particular place, sometimes?—A. Yes, sir; there are many that are termed permanent, that cannot be changed from one room to another.

Q. If that shop was abandoned the result would be that somebody would have to go out and contract for all the articles wanted?—A. Yes, sir; that is the fact. To go back again to the commencement, I would state this: when I first objected, to the Secretary, to the furniture being made inside, because I could not control the price, then Mr. Mullett stated that by the 1st of July last he would be ready to give up the shop; and then I could take the few mechanics and put in the shop and have control of them myself. And the Secretary agreed that it should be done in that way. And then, afterward, they determined to continue the shop; and I went on the 1st day of July to know whether it was to be done as agreed, and the Secretary sent me to Mr. Mullett, who stated that he could not give up the shop. And the Secretary said that he should go on. I did not care anything about having it under my control, only that I might control the price of the article. I did not care who made it.

Q. That is settled now, and you do not care about controlling the men?—A. I do not; I do not care who controls them, so that the work is done.

WASHINGTON, D. C., *June* 25, 1870.

J. L. CHAMBERS sworn by the Chairman and examined.

By Mr. MUSSEY:

Question. State your residence and occupation?—Answer. I am secretary of the Johnson Rotary Lock Company, of New York.

Q. Are you acquainted with A. B. Mullett, of the Treasury Department?—A. Yes, sir.
Q. Has he any interest in the Johnson rotary lock, to your knowledge?—A. He has not.
Q. Did he make any improvement in that lock: and if so what was it?—A. He patented an invention, which was applied to our lock afterward by purchase from him.
Q. How much did he receive for that?—A. One thousand dollars.
Q. Is that all that he has received?—A. Yes, sir.
Q. In any manner?—A. In any manner.
Q. Did you ever say to the machinsit of Mr. Rice, of the Treasury, that Mr. Mullett demanded more than you gave, and that you made it up to him in another way?—No, sir; I do not know the machinist at all; nothing about him; never heard of him that I know of. But I could not have said that, because it was not a fact.
Q. Do you know Mr. William Edgerton?—A. He is our book-keeper.
Q. Please state whether that affidavit is in his hand-writing. [Witness examined the paper handed to him].—A. Yes, sir.
Q. When was the payment of this $1,000 to which you refer made?—A. I think some two or three years ago. I cannot say exactly.

By the CHAIRMAN:

Q. Were you present when that affidavit was sworn to by Mr. Edgerton?—A. Yes, sir.
Q. State the character of the improvement for which Mr. Mullett was paid?—A. It is by such a form of the key that when it is placed in the lock it cannot be withdrawn again without locking the lock. It was applied to our drawers and everything in our use. We thought it an important thing for us, and that it was worth the money.
Q. When was the purchase made of Mr. Mullett?—A. February 9, 1867.
Q. Who made the purchase in behalf of the company?—A. The board of directors: Henry Smith, Mr. Tweed, and Thurlow Weed.
Q. Where was the bargain made; in New York or here?—A. It was made in New York. He came on there and said he had the improvement, which we could have for $2,000. I said it was not worth so much. We had quite an argument over it. Mr. Smith said, "I am willing to pay $1,000 for it." Some one seconded the motion, and $1,000 was paid.
Q. Were you present at the time?—A. Yes, sir; I was secretary at the time.
Q. Was the purchase the purchase of the entire interest in the patent?—A. Yes, sir; it was assigned to us.
Q. How long before that had the patent been secured?—A. Probably two weeks—but a short time.
Q. How long has the Johnson Rotary Lock Company been in existence?—A. Since 1862, I think.
Q. Have you been secretary all that time?—A. No, sir; since 1865.
Q. What sales has your company made to the Government here?—A. We have made very large sales to the Navy, War, and Treasury Departments, the Patent Office—well, all around, to all the Departments and the Post Office.
Q How long since the earliest sales were made to the Departments here?—A. I think in the early part or the middle of 1866.
Q. To whom were the first sales made?—A. The first were made by Mr. Rollins, I think, Commissioner of Internal Revenue. We sold him over 2,000 at one time.
Q. To what other Departments in succession?—A. The locks were then sold to Mr. Mc———, of the Treasury Department.
Q. When were the sales first made to him?—A. About the same time, in 1866. I am here often, and hardly missed two weeks for the last four years that I did not come here.
Q. When were the first sales to Mr. Mullett?—A. The first sales to Mr. Mullett directly were oon after the award was given to our lock, as the best among several entered in competition; mong others the mortise lock.
Q. When was that?—A. It was in 1866, I think. I cannot state exactly.
Q. Was it before or after the sale to Mr. Mullett of this lock?—A. It was before. As far as regards the purchases made by Mr. Mullett, I do not think that where he has had the selectionour sales have amounted to 2,000, instead of 3,000 or 4,000. The goods have been ordered by the chiefs of divisions, Mr. Spinner, and others. Of course, these had to go through Mr. Mullett.
Q. Had he a right to overrule and control the matter?—A. Yes, sir; he could check it and get what he thought desirable.
Q. At the time of the purchase of the interest in the patent was anything said as to the purchasing of your lock from the company for the Treasury Department?—A. No, sir; we did not think much of the invention at first; and we did not put the lock anywhere here but at the Post Office Department, and then we introduced it at the Treasury Department. Mr. Spinner's Bureau was the only place where we put them on at first.
Q. You say Mr. Mullett's price was $2,000?—A. Yes, sir.
Q. But he took $1,000?—A. Yes, sir.
Q. What was the inducement for that large reduction in his price?—A. We would not give him any more.
Q. Has he made any use of his patent himself in attempting to use it in connection with

any other lock?—A. I could not tell. Whether he tried to sell to some one else before he tried to sell to me I do not know. I saw that it was useful to me, and therefore bought it.

Q. Did you ever have any conversation with any person of the kind suggested by Mr. Mussey's question; that is, intimating that Mr. Mullett, not being entirely satisfied with the price you paid him, it was to be made up in some other way?—A. No, sir; never.

Q. Have you ever understood, from any source, that Mr. Mullett was to have any share whatever in the proceeds of the prices paid for sales made by your company for the locks sold to the Government?—A. Not until the intimation was made by Mr. Mussey himself, who told me that some one had said so before the committee.

Q Was that the first you had heard of it?—A. Yes, sir.

Q. Have you heard it intimated that he was to have a commission for purchases made by the Government?—A. No, sir; not in any manner, neither directly nor indirectly.

Q. Who are the leading stockholders in your company?—A. Henry Smith is president; William M. Tweed is vice-president; and Thurlow Weed.

WASHINGTON, *June* 15, 1870.

A. G. MILLS sworn and examined.

By the CHAIRMAN:

Question. What is your residence and occupation?—Answer. I reside in Washington; I am chief clerk in the office of the Supervising Architect.

Q. How long have you had that position?—A. Since July 1, 1869. I acted in that capacity two months prior to that time.

Q. Were you in any way connected with the office before that time?—A. Yes, sir; since August, 1866, I had acted as clerk on special business.

Q. Have you calculated the percentage of profit, including royalty, of the Vaux's Patent Anti-freezing Pipe and Roofing Company on their work done for the Treasury Department within the last year?—A. Yes, sir; for so much of it as has been completed.

Q. Is this a statement of the result of your calculations? [Handing a paper to witness.]

Statement exhibiting the actual percentage paid by the Treasury Department upon the net cost of materials and labor supplied by the Vaux Patent Anti-freezing Pipe and Roofing Company, for putting copper roofing and guttering on the public buildings herein specified, as shown by the vouchers for payment to that company.

United States custom-house at Cairo, Illinois:

Net cost of material and labor supplied		$4,888 28
Contractor's profit, under agreement, 15 per cent. thereon	$733 25	
Royalty paid to the patentee, 2,709½ square feet of roofing, at 10 cents per foot	270 95	
		1,004 20
Aggregate amount paid by the United States		5,892 48

Or,

Net cost of materials and labor, as above	$4,888 28
Plus $20\frac{6320}{11639}$ per centum thereon	1,004 20
Aggregate as above	5,892 48

United States custom-house at Richmond, Virginia:

Net cost of materials and labor			$7,603 75
Contractor's profit, as in the preceding case, 15 per cent		$1,140 56	
Royalty on roofing as above, 8,650 square feet, at 10 cents	$865 00		
Royalty on pipe, 1,122 feet, at 10 cents	112 20		
		977 20	
			2,117 76
Aggregate cost to the United States			9,721 51

Or,

Actual cost of materials and labor	$7,603 75
Plus $27\frac{28899}{30415}$ per centum thereon	2,117 76
Aggregate as above	9,721 51

United States court-house at Madison, Wisconsin:

Net cost of materials and labor		$8,496 16
Contractor's profit, 15 per centum thereon	$1,274 42	
Royalty on roofing 7,223 square feet, at 10 cents	722 30	
		1,996 72
Aggregate cost to the United States		10,492 88

Or,

Net cost of materials and labor	$8,496 16
Plus $23\frac{26627}{53101}$ per centum thereon	1,996 72
Aggregate as above	10,492 88

United States custom-house at Portsmouth, New Hampshire:

Net cost of materials and labor		$5,996 29
Contractor's profit, 15 per centum thereon	$899 44	
Royalty on roofing, 6,750 square feet, at 10 cents	675 00	
		1,574 44
Aggregate cost to the United States		7,570 73

Or,

Net cost of materials and labor	$5,996 29
Plus $26\frac{1540 46}{599629}$ per centum thereon	1,574 44
Aggregate as above	7,570 73

Des Moines, Iowa, court-house:

Net cost of materials and labor		$6,912 04
Contractor's profit, 15 per centum thereon	$1,036 81	
Royalty on roofing, 7,588 square feet, at 10 cents	758 80	
		1 795 61
Aggregate cost to the United States		8,707 65

Or,

Actual cost of materials and labor	$6,912 04
Plus $25\frac{163000}{172801}$ per centum thereon	1,795 61
Aggregate as above	8,707 65

Marine hospital at Portland, Maine:

Net cost of materials and labor		$5,888 38
Contractor's profit, 15 per centum thereon	$883 25	
Royalty on roofing, 9,158 square feet, at 10 cents	915 80	
		1,799 05
Aggregate cost to the United States		7,687 43

Or,

Actual cost of materials and labor	$5,888 38
Plus $30\frac{162680}{294419}$ per centum thereon	1,799 05
Aggregate as above	7,687 43

Custom-house at Portland, Maine:

Net cost of materials and labor			$5,559 15
Contractor's profit, 15 per centum thereon		$833 87	
Royalty on roofing, 1,811 square feet, at 10 cents	$181 10		
Royalty on pipe, 936 feet, at 10 cents	93 60		
		274 70	
			1,108 57
Aggregate cost to the United States			6,667 72

Or,		
Actual cost of materials and labor		$5,559 15
Plus $19\frac{104663}{111183}$ per centum thereon		1,108 57
Aggregate as above		6,667 72

Court-house and post-office at Portland, Maine:

Net cost of materials and labor			$2,934 36
Contractor's percentage, 15 per cent		$440 14	
Royalty on roofing, 2,455 square feet, at 10 cents	$245 50		
Royalty on pipe, 640 feet, at 10 cents	64 00		
		309 50	
			749 64
Aggregate cost to the United States			3,684 00

Or,	
Actual cost of materials and labor	$2,934 36
Plus $25\frac{13375}{24453}$ per centum	749 64
Aggregate as above	3,684 00

The average percentage paid on the cost of the materials and labor for the works herein specified is 25 per centum.

A. Yes, sir; the paper I hold in my hand I believe to be a correct statement of such percentage.

Q. Has any work been done for private parties at the cabinet or carpenter shops connected with the office of the Supervising Architect, or by the workmen employed therein, since you became acting chief clerk?—A. There has none to my knowledge.

Q. At what time was the doing of such work stopped and by whom?—A. Shortly after Mr. Boutwell became Secretary of the Treasury, by order of the Supervising Architect, under the instructions, as I am informed, of the Secretary of the Treasury.

Q. And since that time, as far as you are informed, has there been any work done for private parties at those shops?—A. There has not. It may be proper to refer to a very small item of work done by an employé of the Treasury for the chief clerk of the Department, Mr. West, but a matter that involved no expense to the Government. Some two or three years ago one of the workmen fixed the chimneys at the residence of the chief clerk; they became deranged in some way, and the chief clerk was anxious to have the same man who had done the work originally make the repairs. The work was paid for by Mr. West, as I understood, and no time was lost to the Government; it was in no way any expense to the Government. The work occupied only an hour or two. I might add, that for that work I alone am responsible; it was a small affair, I know, but I wished to be accurate, so I mentioned it.

Q. Before March, 1869, was work done at those shops for private parties?—A. I believe there was.

Q. What evidence have you on the subject; have you, as chief clerk, possession of any books of the office which bear evidence of work having been done for private parties, or what was the course pursued in regard to such work?—A. The cost of the work was charged to the parties for whom the work was done, as I am informed. I cannot state from my own knowledge that any work was done prior to my entering upon the duties of chief clerk, as it was a matter with which I had no connection up to that time.

Q. Do the books show this work to have been charged and paid for by the parties for whom it was done?—A. The books which I have examined do not in all cases bear evidence of payment.

Q. Have you a statement of accounts that are yet unsettled?—A. Yes, sir; I have here a list containing the names of persons for whom work was done, with the word "paid" written in pencil opposite those who, as it appears from the books, have paid for the work done for them. I know nothing personally about the matter; the list was furnished me by Mr. Steinmetz, assistant superintendent; he informs me that it embraces the names of all parties for whom private work has been done who have not yet paid for the same:

Memorandum of sundry unpaid bills in favor of the Treasury Extension, presented since April 5, 1869, *requesting payment of same to Thomas J. Hobbs, Esq., disbursing clerk, Treasury Department:*

Hon. William Sprague	$47 71
Hon. Montgomery Blair (Paid.)	122 88
George E. Baker, disbursing clerk, State Department	15 62
Office Comptroller of Currency (Paid.)	122 40

M. G. Emery & Co	(Paid.)	$80 18
John H. Ridgway		76 33
B. Oertly	(Paid.)	61 89
Dr. J. C. Duhamel		30 35
Brigadier General N. Michler	(Paid.)	225 25
George O Evans		240 66
William H. West	(Paid.)	41 47
S P. Brown	(Paid.)	18 00
George B. McCartee	(Paid.)	3 25
A. B. Mullett	(Paid.)	57 31
J. C. Rankin		12 88
S. F. Carr		13 91
H. S. Safford		14 05
W. G. Steinmetz		4 96
Hon. William Johnston		102 37
James Davis		37 10
William Slade		91 32
James L. Thomas		75 00
H. R. Hulburd		50 00
Comptroller of Currency	(Paid.)	25 00
Total		1,569 89

Q. Do you know where Mr. Steinmetz obtained this account?—A. From an examination of the records under his charge, and from the disbursing clerk who makes disbursements of the money, and to whom payment for private work is made. I took this paper to the disbursing clerk after it was handed me by Mr. Steinmetz, and asked him if it was correct; he looked over it and said he believed it to be correct.

Q. Who made this list in the first place?—A. Mr. Steinmetz's clerk.

Q. From books in his possession or charge?—A. I do not know from what source.

Q. Have you compared it with the books in your possession to know whether or not it agrees with them?—A. No, sir.

Q. As chief clerk you have possession of the account books of the Supervising Architect of the Treasury?—A. Yes, sir.

Q. And have you not compared this list with the books in your possession? Do you know whether or not it agrees with the books in your possession?—A. I have not.

Q. On the margin of that account there are certain items against which the word "paid" is written in pencil; where did you get the information in regard to those accounts having been paid?—A. When the list was made up, Mr. Steinmetz took it to the disbursing clerk and he marked those accounts in pencil as having been paid.

Q. Please state the method by which orders for furniture are made in the Treasury Department, and the accounts therefor settled.—A. When the head of a bureau wishes an article of furniture made for the use of his office he makes a requisition for it on the General Superintendent of the Treasury Building; the Superintendent, after satisfying himself of the necessity or propriety of procuring the article for the use of that office, makes a requisition for it on the Supervising Architect. The Supervising Architect, if he sees nothing improper in the requisition, directs Mr. Steinmetz, the immediate superintendent of the shops, to make the article. The article is then made in the shop, the foreman of the shop keeping an accurate account of the materials and the labor, which account appears in the reports rendered daily.

Q Does the superintendent of the shop charge to each separate article which is being made in the shop the amount of time employed upon it, and the amount of material used in its construction?—A. He does. When the article is finished it is taken by men employed in the shop to the office for whose use it is designed; and at the end of the month the superintendent of the shop reports to the office of the Supervising Architect the cost of the material and labor of all work done in the shop during the month. Thereupon a bill is made up based upon that report and presented to the Superintendent of the building for payment. Only those articles which have been completed and delivered are so charged; no charge is made for those which remain as yet unfinished. The bill thus presented is, after examination by him, referred to the accounting officers for examination and settlement, and the amount found to be due carried by counter-warrant from the appropriation for furniture for the Treasury building to the credit of the appropriation for alterations of the Treasury building, or Treasury extension.

Q. Is the account, when presented by the office of the Supervising Architect to the Superintendent of the building for settlement, referred by him at once to the accounting officers for examination and settlement, or does he take any preliminary steps to ascertain the correctness of the account as rendered by his office?—A. He has to satisfy himself of its correctness: that the article has been furnished the officer who makes the requisition.

Q. Satisfy himself in what way?—A. In any way he can; sometimes by personal inspection, sometimes by subordinates examining into the matter. He obtains the signature

of the bureau officer, or some responsible clerk, that the article has been received, and that receipt the Superintendent places on file in his office.

Q. Then, before he refers the account of your office for work for settlement, he obtains from the office of the Bureau which originally made the requisition the receipt of its head or chief clerk that the article has been received?—A. That is the regular course.

Q. But with that you personally have nothing to do?—A. No, sir; it is their business.

Q. Does your office take any receipt from the officer for whom the article was ordered that it was delivered to him?—A. None whatever; we have nothing to do with that officer, unless it be to take directions as to the manner in which work should be done.

Q. The article is sent directly from the shop to the Bureau for which it was ordered?—A. Yes, sir, usually; that is simply a matter of accommodation to the Superintendent. The regular course would be to leave it at the office of the Superintendent, but if the article were a heavy case, or something of that sort, that might greatly incommode the Superintendent, it is taken directly to the place for which it is intended.

Q. As a matter of fact is it not proper to take the receipt of that officer?—A. I never thought there was any necessity for it, nor do I think it would be proper to require such officer to receipt to our office, as he obtains the article from the Superintendent and gives him a receipt for it.

Q. Nothing of that kind is done, at any rate?—A. No, sir.

WASHINGTON, D. C., *June* 29, 1870.

A. G. MILLS recalled.

By the CHAIRMAN:

Question. Have you brought the statement with reference to the private work done at the workshops under the charge of the Supervising Architect of the Treasury, which you were requested to have prepared?—Answer. I have. (Producing it.)

Q. Is there anything in it that needs explanation?—A. There are four accounts here, in which balances still appear due, and I will make such explanation as I can concerning them. The first is a charge against William Brown for shoeing a horse. The work was performed December 21, 1868, and the charge is $1 29. As nearly as I can ascertain. that man was at the time in the employ of the Treasury extension, and Mr. Steinmetz has been unable to find him recently in order to collect the bill; but he says he has no doubt he can find him.

Q. Have you a blacksmith shop connected with the Treasury extension?—A. Yes, sir, it has been used as long as I have been connected with the office. It was used at the time we were building the north wing of the Treasury, and also. I believe, when the west wing was being built. It was used for shoeing horses, sharpening tools, and preparing the iron work to be put in place in the building.

Q. Is that shop yet kept up?—A. I think so.

Q. Have you any knowledge as to how many persons are employed in it?—A. No, sir, I have not.

The next is a bill of seven cents, due on the account of Hon. W. H. Seward. It appears that the whole bill of $21 77 was transmitted to Mr. Seward, and that he at once sent a draft for $21 70. It is presumed that he made an error of seven cents in writing the draft.

The next is a charge of $30 35 against a person by the name of W. J. C. Duhamel. I understand that he was a practicing physician in this city, and was for a time, I believe, the physician to President Johnson; at all events, he was in some way connected with the White House. Efforts were made to procure the payment of this bill, but without success. It is entered here as a bill for repairing and painting buggy. He undoubtedly had that done there through his connection with the White House.

There is one other item which might not be understood standing by itself. It is a charge of $240 66 against George O. Evans & Co. It is entered for experimental gas-works for Treasury building. This company desired to make a contract for supplying the Treasury building with gas, and the Secretary of the Treasury, Mr. McCulloch, was disposed to allow them to try the experiment, provided it would not be expensive to the Government. Under the agreement, as I am informed, the Treasury Department was to erect a building for them suitable for them to put in their apparatus, and it did so. The gas was actually introduced into a portion of the Treasury building. The experiment, as I understand, proved a failure, and the Government did not make a permanent contract with that company for the supply of gas. There has been no final settlement with the company as to the difference between the price of the gas furnished and the work performed for them in putting up this building; but the building, which is worth $500 or $600, still remains on the ground, and we are now using it as a shop, and have it as a set-off to the bill of $240 66 until such time as a final settlement may be made. These are the only accounts which remain unbalanced.

Q. Have the others all been paid?—A. The others have all been paid in full.

Q. That statement shows all the work ever done for private parties at any of the shops connected with the Treasury Department, while Mr. Mullett has been Supervising Architect?—A. Yes, sir.

The statement was put in evidence as follows:

Statement of work done in the workshops of the Treasury extension for private parties, as it appears from the books of the Treasury extension, since the date of appointment of A. B. Mullett, esq., as Supervising Architect, the amounts charged for the same, and how and when paid.

No.	Name.	Dates at which work was performed.	Nature of the work.	Amount charged.	How paid.	When paid.	Amount.	Balance due.
1	Wm. Slade, (late steward of Executive Mansion.)	From Sept. 2, 1867, to June 24, 1868.	Shoeing horses and keeping the same; repairing buggy and carriage, &c.	$441 32	By cash to disbursing clerk. Do..... By check.....	August 13, 1867.... March 9, 1868..... April 1, 1869..... June 27, 1870.....	$100 00 150 00 100 00 91 32	
							441 32	Balanced.
2	C. W. Walton.....	Sept. 2, 1867, to Dec. 12, 1867.	Repairing buggy and shoeing horses	14 63	Cash as above	Sept. 30, 1868.....	14 63	Do.
3	B. Oertly.....	Sept. 2, 1867, to May 18, 1868.	Moving furniture, water pipes, and repairing each, &c.....	61 89	..... do	Dec. 1, 1868	61 89	Do.
4	W. H. West, C. C..	Dec. 14, 1866, to March 11, 1868.	Fitting up stoves and chandeliers, gas-pipes, and brackets, carpentry, &c.	61 86	..... do	July 1, 1869	61 86	Do.

By Mr. MUSSEY:

Q. State whether the superintendent has any method of controlling the expenses of the furniture.—A. He can control the cost of the furniture if he chooses. Before issuing his requisition for the furniture, he can obtain an estimate of its probable cost, and he has recently, in some cases, obtained such estimates.

Q. Has there ever been any impossibility in the office in the way of his obtaining estimates?—A. Never, to my knowledge.

Q. Did he ever apply for an estimate and fail to obtain it?—A. Never.

Q. You say he has recently obtained estimates; since when?—A. Since the latter part of the month of March.

Q. Do you know of any reason for his obtaining estimates from that time on?—A. The Secretary directed him, in a letter dated 16th March, I think, to obtain estimates from Mr. Mullett before work was ordered from the shop—such work as cases and other furniture that would probably be expensive.

Q. Did you yourself, with Mr. Mullett, have anything to do with obtaining that order from the Secretary?—A. I think I was the immediate cause of the order being issued. About the middle of March, Mr. Rice, the superintendent, took to the Secretary a bill for furniture made in the shops of the Treasury extension during the month of February, and objected to the price charged for a case which was included in that bill. As soon as I learned the cause of the delay in the payment of the bill, I called upon the Secretary and protested against his entertaining the objection at that time. I took the ground that the case having actually been ordered, without limitation as to cost, and no estimate having been required as to the probable cost, it was too late to raise the objection. The returns of the master mechanics showed that the case had actually cost the amount stated, and there was no reason why the bill should not be paid at once. I also suggested to the Secretary the importance of requiring Mr. Rice to obtain estimates before ordering work that might prove expensive. I told him it was the invariable practice in my office, and, as far as I knew, in all the offices of the Government intrusted with the expenditure of money, and I knew no reason why Mr. Rice should not do it. I told him that, in consequence of his not doing so, Mr. Rice had made requisitions on our office for furniture, which would cost at least $30,000 more than he had money to the credit of his appropriation to pay for; and that we were actually obliged to stop work, for the reason that we learned we could not have our bills paid if we filled all his requisitions. Thereupon, within a day or two, the Secretary issued an order to Mr. Rice, requiring him to obtain estimates from Mr. Mullett in all cases where any work likely to be expensive was ordered of Mr. Mullett, and he at the same time instructed Mr. Mullett to furnish such estimates when called for.

Q. Do you know whether efforts were made prior to that time to obtain an order of the kind?—A. I know of none. I think there would have been no difficulty in obtaining an estimate. It was the practice of Mr. Steinmetz to furnish Mr. Mullett with estimates frequently on that very work.

WASHINGTON, D. C., *June* 29, 1870.

W. G. STEINMETZ sworn and examined.

By the CHAIRMAN:

Question. State your occupation.—Answer. I am a civil engineer. I am assisting superintendent of the alterations in the Treasury building, and sworn measurer to the Treasury Department.

Q. You are assisting the Supervising Architect?—A. Yes, sir.

Q. Is Mr. Mullett superintendent in the alterations of the Treasury building?—A. Yes, sir. If Mr. Mullett were not here, and were somewhere else, I would be superintendent.

Q. Have you an appointment from the Secretary of the Treasury as assistant superintendent?—A. No, sir. I have my appointment from Mr. Mullett.

Q. Are you in the office of the Supervising Architect of the Treasury?—A. I am connected with the office.

Q. How long have you been connected with it?—A. Since the 1st of July, 1863.

Q. In what capacities?—A. I have been draughtsman until the middle of 1867, and from that time I have been acting in the capacity of engineer to lay out the works in the north wing of the Treasury building. I continued in that capacity until about the middle of 1868, when I was appointed assistant superintendent of the works.

Q. Is there any branch of civil engineering to which you have given particular attention?—A. Yes, I have been laying out the circular street around the President's grounds, &c.

Q. Have you ever given any special attention to architecture?—A. Only as architectural draughtsman in the office.

Q. Have you recently examined the work going on in connection with the post office building in New York?—A. Yes, sir; I was sent to New York, the first time, in February or March last, to lay out the work for what they call the fine cut stone. I had, at that time, a good deal of work to get the lines in a correct position owing to the way the cellar was dug out. The bottom of the cellar is about 30 feet below the sidewalk, and only one-half

of the cellar was dug out. The other half was not touched, and the derricks, stones, and other things were on the ground. My object was to get the center line, and, in order to do it, I had to erect two or three scaffoldings 30 feet high, and distant from each other between 20 and 30 feet, so as to get the line as nearly level as possible. This kept me in New York longer than I anticipated, and Mr. Mullett required me, of course, to remain there until the thing was so that workmen could go to work. I had two civil engineers to aid me, Mr. McLean, the city surveyor, and his assistant. We finally fixed an assisting point in the center of the building, and I found that my lines were as correct as they could possibly be got. We always allow a small mistake for a certain length. Of course, if you have to measure 500 yards with an iron rod of 20 feet, marking each end with a sharp knife, the continuation of that knife makes a difference in the aggregate length, but still, a difference so slight that we always take it as accurate. After finding my point for the center, I remeasured to all the sides, and fixed the points in the cellar, marking the stone with a chisel mark, which can be found to-day. About three weeks ago I was sent to New York to lay out, with the assistance of those two gentlemen, the points for the iron columns in the cellar. Mr. Mullett requested me to go over my first lines and to be sure that everything was correct. I did so, and almost every test that was made verified my first measurement. Consequently I began to lay out the third row of columns from the City Hall Park front, beginning with the third column, because the first and second rows of columns I could not lay out, the ground not being dug down yet. Up to the third row of columns I could work with the greatest accuracy. Then I laid out the two rows of columns running parallel with the Broadway front, and also the line into the court-yard parallel with the Broadway front. I also laid out the elevators and the ventilating stakes, and tested the work again, and the men started immediately to work on my lines.

Q. You heard the testimony of Mr. Wyman yesterday with reference to certain supposed inaccuracies in the work?—A. Yes.

Q. What have you to say to them?—A. All I have to say about them is this, that if any competent person would look at the work and find any mistakes, I would accept such mistakes, but I cannot find any mistake in anything Mr. Wyman has spoken of, except as to one point; the mistakes are of no account at all.

Q. You superintended the erection of the north front of the Treasury building?—A. Yes, sir.

Q. What other buildings, if any, have you superintended the construction of?—A. No other in this country, but I have been engaged in building in my native country, Prussia. I was engaged in the erection of one large building in Cologne, and two churches there; and I was also engaged on the railroad from Treves. The public building that I speak of in Cologne was a very large fire-proof building for the city authorities.

Q. Where were the two churches you speak of?—A. One was a Gothic church in Cologne, and the other was a church in Holland. I was superintendent of the stone work on both churches.

Q. Something was said about certain iron columns having been too long, and necessitating a lowering of the floor; what is the fact about that?—A. That is one point in which I agreed that Mr. Wyman was, in so far, correct. The drawings were made while Mr. Mullett was in California. They were made by Mr. Cammerhuber in the office, a very able man, who had been connected with Mr. Cluss, the architect here, who has built many public buildings in this city. Mr. Cammerhuber, believing that he would make an improvement, constructed the columns in such a way as to sink the cap of the columns in the granite stone. Mr. Mullett, on coming back and looking at the drawings, immediately found that it would cost more money to cut out these holes than to place the columns in the ordinary way, and, consequently, he immediately ordered that the stone should not be cut out the three inches, but that the columns should remain as they were, and that the top course should also remain without being cut; and that the footing stone should be cut off three inches; but that did not make any additional cost.

Q. The alteration was one in the interest of economy?—A. Yes, sir. Each stone would have cost to cut it out three inches from $75 to $100.

Q. What was the expense of the change?—A. I would charge it at about $1, because the cutter had only to cut a little more down. He had to level the stone, and whether he cut it down an inch or two more or less would not make any material difference in the labor.

Q. The original plan, as I understand, would have been an excellent one, but the advantages were not equal to the expenses?—A. Yes, sir. Both plans were according to the proper principles of architecture; though Mr. Mullett would not have permitted the other to be drawn if he had been here.

Q. With reference to angles, state how angles, derived by geometrical calculation from the elements of triangles, agree. State whether they ever agree with geometrical accuracy over large spaces, such as you have in that building.—A. They should; but here was the difficulty which Mr. Wyman did not understand. We were compelled to take the city surveyor's plat. The Government property had never been measured, perhaps, since its donation to the Government, and the lines had never been established. The first plat received from the city surveyor was not correct, we found some mistakes there. Mr. Mullett immediately sent word back, and then received another plat with a slight variation, and on that we have to go on with the work. It did not make any difference in the foundations whether

they were an inch or two inches out of the way, because we always allow for the foundation pier sufficient spaces. So they went on and laid the concrete bed, and afterward the rubble foundation. During this time the plans were corrected. The office came to the conclusion to adopt certain lines, and it did so. That one line was not parallel with the other, it is true. There are 21 inches difference between the property line and the line which we adopted on park front. Mr. Mullett took in these 21 inches on the one end, running to nothing on the other end. There is where the difference comes in. The lines now are strictly parallel.

Q. What is the fact in reference to this pier at the intersection of the Broadway and Park street fronts, and which was claimed to be a little out of place?—A. We set the piers rough, with rubble granite stone. When I went there I tried to get lines on those piers, but I found it utterly impossible. We never care for foundation piers bulging an inch one way or another, so long as the fine work is on its proper place, and in that case the fine work is on its proper place.

Q. Have you yet reached a point where the fine work is in place?—A. Yes, sir. On the Broadway side the fine work is set on the pier that Mr. Wyman refers to. On the west front and the park front, all the piers are up to their proper height. They were measured with great accuracy, and I remeasured them again to be sure that they were correct. I remeasured the work a week ago, the last time that I was in New York.

Q. Something was said about certain girders being too short.—A. That is utterly impossible. We can strictly calculate up to the tenth of an inch, but we have to go by the plan of the ground and have to depend upon actual measurement. That is why Mr. Mullett long ago notified the contractor that the end stones for the angles should be left two or three inches longer than the measurement, so that they could be cut to the proper measure on the ground. The other stones may be set, but the last one must be what we call "fitted." That is what I have done here on every course in the Treasury building.

Q. Some fault was found with reference to certain stones that were originally designed with a projection of four inches on one side, to support the sidewalk, and which had a corresponding projection on the other side, which was thought to be unnecessary; what have you to say to that?—A. (Illustrating by means of a sketch.) Mr. Mullett ordered one of the projections to be cut off. There were only a few ordered with the projection on both sides, and the rest were ordered to be cut without it.

Q. And changing the plan, you think, was an advantage, and saved expense?—A. Yes, sir. Very few stones with projections on both sides had been delivered.

Witness went on to illustrate and explain by diagram the objection made by the witness, Mr. Wyman, in reference to pier E.

WASHINGTON, D. C., *July* 2, 1870.

W. G. STEINMETZ recalled and examination continued.

By Mr. MUSSEY:

Question. In relation to cutting into the stone for the columns, and the subsequent cutting down of the stone, state what space would have been requisite by the original plans to be cut into the stone.—Answer. It would require to be cut 3 inches deep, and about 2 feet 2 inches or 2 feet 6 inches square.

Q. You stated that the expense would be $75 or $100; what would have run it up to that amount?—A. To cut the stone, and at the same time to fit it exactly in its proper place. I do not believe, with the construction as it was at first, the stone could have been set straight.

Q. You stated the other day that the stone had been cut down three inches to meet the change in the plan; have you examined since then to find out how that is?—A. Yes; the footing stone for the column has been altered. The height of the pier on which this footing stone rests was given, and was not required to be reduced. The space above the columns could not be or should not be changed, consequently the difference of these three inches had to be made in the footing stone, which had not been delivered at the time.

Q. So that it really involved no expense?—A. No expense at all; but it saved these three inches of stone.

Q. As to pier E, Mr. Wyman said that the offsets on it were not even. Is that of any practical importance in a building?—A. Not in the least; none at all.

Q. Of what sort of stone is this pier E built?—A. The cellar piers are all of rough granite, not dressed at all, but sometimes chipped off.

Q. What degree of accuracy do you endeavor to get in building from this rough stone?—A. We do not get any accuracy with rough stone. If I have to build on a rough stone wall, I have to lay lines on it and build by those lines. I cannot take the outline of any rough stone wall as a line to build any superstructure on.

Q. You have laid out lines for the fine set work?—A. Yes, sir.

Q. And those are laid off accurately in accordance with your plans?—A. Yes; in accordance with the plans of the office.

By Mr. ELA:

Q. This idea of sinking the iron columns into the stone was a wrong design of the constructor originally?—A. Yes; but he had a reason for it. Mr. Cammerhuber was a very competent man, and he thought that in this way he would protect the iron work so that it would not yield either way; that he would bind the iron work by sinking it in the stone.

By Mr. MUSSEY:

Q. Does the slight variation in the rough pier E from the true line affect at all the line of the superstructure?—A. Not at all.

Q. How much offset in a rough pier like that is necessary to give sufficient strength to the superstructure?—A. No offset at all is necessary, because the pier has a solid foundation of concrete four feet deep, projecting one foot three inches on each side round.

By the CHAIRMAN:

Q. You found, as I understand, that the lines as given you by the city surveyor were not parallel?—A. They were not parallel, and therefore we had to make a parallel line on the Broadway front.

By Mr. MUSSEY:

Q. Does that affect the superstructure at all?—A. Not at all. It only facilitates the work. We do not lose any ground at all by it; but in this way we ep the whole building symmetrical.

By Mr. ELA:

Q. Have you ever looked over the specifications for the iron beams, which Mr. Wyman said were many inches too long, to see whether the mistake actually existed?—A They never have been made. I am now measuring the positions for the columns, and as soon as the footing stones for the columns are set, the actual distance will be measured on the ground.

Q. Have not the advertisements gone out for furnishing beams of a given length?—A. Those beams that are advertised for are beams that are run into the wall, and it makes no difference whether or not they are an inch or two longer. The practical question is to see that they are not too short. If they are two inches longer than they were ordered, all that is necessary is to deepen the hole in the wall that is to receive them two inches more, and there is no difficulty about that. In every building where beams have to be fitted we only give the lengths after the footing stones are set and measured, and we always send a pattern lest there might be any difference in the rules of measurement.

By the CHAIRMAN:

Q. The statement which you have submitted to me this morning was prepared by you, and shows the cost of the furniture manufactured in the shops of the Treasury Department?—A. Yes, sir.

Q. And the figures which it contains are correct?—A. They are. Every piece of furniture can be seen in the building yet.

The statement was put in evidence, and is as follows:

Statement in regard to the furniture made in the cabinet shop connected with the Treasury extension, viz:

1st. One desk for Third Auditor, November 29, 1867, $119 37.—This was a large book and file case, 13 feet 6 inches by 11 feet 6 inches, for room 55 of the Third Auditor's Office. The file case fitted up with pigeon-holes, which required a large amount of additional labor and material, and adds not less than 20 per cent. to the cost of an ordinary book-case. This case was made of solid mahogany and in the very best manner, and is now in as good condition as when first constructed.

2d. Two desks for Secretary's office, January 4, 1869, $322 43 each.—These were two large double standing desks for four clerks, with rollers for books, &c., made under special instructions and of the best mahogany, or, in other words, double the number of desks stated by Mr. Oertly.

3d. Two desks for Architect's office, $330 57 each.—These were two large double desks for four clerks, or for twice as many single desks as were given by Mr. Oertly.

4th. Two standing desks for Fourth Auditor, $500 12½ each.—These were two double standing desks for Fourth Auditor, one side 13 feet, and the other 17 feet 3 inches long; the peculiar nature of the business for which they are used requiring desks of this size. They would give ample accommodation for seven clerks engaged in ordinary business.

5th. One walnut book-case for Light-house Board.—This was a walnut desk and file case combined, and of a special finish.

6th. One mahogany book-case for Treasurer, $849 33.—This was a large book and file case 10 feet 4 inches by 13 feet, fitted with pigeon-holes, which, as before said, largely increases

the cost of such a piece of furniture over one fitted up in the ordinary manner, with the same external appearance.

7th. One case for Fourth Auditor, $4,098 56.—This covers four cases for Fourth Auditor's office, 20 feet 6 inches long by 13 feet high, two being placed back to back between doors 27 and 29, and two between doors 23 and 25, first floor, each case being fitted up with pigeon-holes and shelves for books, thus making four cases instead of one, as stated by Mr. Oertly.

8th. One case for Fourth Auditor, $1,182 91.—This case covers the entire superficial area of one end of a room 20 feet 6 inches long by 13 feet high, fitted up with pigeon-holes and shelves.

9th. One case and desk for Fourth Auditor, $1,104 70.—This is also a case covering the side of a room 20 feet 6 inches long by 13 feet high. This case has about the double depth of any of the other cases.

10th. One case, $913 75.—This is the case for the warrant room, 20 feet 6 inches long and 13 feet high, of solid mahogany, fitted up with pigeon-holes and shelves. This case has been made over two years ago, and removed from another room to the present place, and is in excellent condition.

All of the furniture specified above is made of the very best quality of seasoned mahogany lumber, and in the best manner. Though much of it was made some years ago, and exposed to the dry heat of the Treasury building, it is all now in practically as good condition as when first constructed, and will last many years. I now desire to call your special attention to the furniture made under contract for the Treasury Department, of which a great part was ordered and paid through Mr. Oertly during the time he was in charge of the office of Supervising Architect. But few of the articles remain in the building, most of them having become entirely useless and been removed. Of those that remain I will mention the following:

1865.—Book-case for Register's office, 11 by 15 feet, made of cherry, without pigeon-holes, cost $650, or at the rate of $4 17 per superficial foot. The doors are badly shrunk, locks out of order, and the case generally in bad condition.

A solid mahogany case, 12 by 20 feet, of same construction, made in Treasury extension shops for Comptroller of Currency, cost $961 52, at the rate of $4 06 per superficial foot.

1866.—A second case of same material and construction for Register's office, 11 by 12 feet, cost $650, or at the rate of $4 92 per superficial foot. Treasury extension case, of same kind, for Register's office, 12 by 12, sash doors, and of solid mahogany, cost $611, at the rate of $4 24 per superficial foot.

1866.—Two book-cases of ash, 11 by 12 feet, for Register's office, cost $1,000, at the rate of $3 78 per superficial foot. One of which cases has pigeon-holes. Both of these cases are in very bad condition; doors do not fit and the locks are out of order.

Similar case of solid mahogany, made at Treasury extension shops, for warrant room, at a cost of $913 75, at the rate of $3 70 per superficial foot.

1866.—Two double cases of pine for Light-house Board, partly full of pigeon-holes, under contract with A. Grant, cost $2,430 70, or at the rate of $3 39 per superficial foot. Vouchers for these cases certified to by Mr. Oertly. These cases are now entirely worthless.

One double ash case, full of pigeon-holes, made in Treasury extension shops for Solicitor's Office, 12 by 40, cost $1,609 42, at the rate of $3 36 per superficial foot.

Two mahogany cases, made by E. H. King, for Commissioner of Customs, 13 feet by 14 feet 3 inches each, cost for both $2,012 24, with pigeon-holes, at the rate of $5 43 per superficial foot.

One book and file case of mahogany for Third Auditor's office, 11 feet 6 inches by 13 feet 6 inches, with pigeon-holes, made in the shops of the Treasury extension, at the cost of $719 37, at the rate of $4 74 per superficial foot.

One ash case for room 10, second story, 12 by 20 feet 6 inches, less 16 feet square left out in center, made by T. J. Suter, cost $1,000, no pigeon-holes, at the rate of $5 per superficial foot. Contract awarded by Mr. Oertly.

One mahogany case for Fourth Auditor's office, paymaster's division, with large pigeon-holes, 20 feet 6 inches by 13 feet, cost $1,104, at the rate of $4 10 per superficial foot. Made in Treasury extension shops.

One mahogany double case for Fourth Auditor, each 20 feet 6 inches by 13 feet, cost $2,049 28, at the rate of $3 84 per superficial foot. Made in the Treasury extension shops.

In conclusion I have to state that all the furniture made in the shops of the treasury extension is in excellent condition, and needs almost no repairs, while that made outside of the Department was and is in constant need of repair.

I am, very respectfully,

W. G. STEINMETZ,
Assistant Superintendent and Sworn Measurer.

A. B. MULLETT, Esq.,
Supervising Architect Treasury Department.

WASHINGTON, D. C., *June* 28, 1870.

JONATHAN WYMAN sworn and examined.

By the CHAIRMAN:

Question. State your residence and occupation.—Answer. I reside in New York. I call myself a clerk.

Q. Were you employed for some time at the post office building in the city of New York?—A. I was, from September, 1869, to May, 1870.

Q. What was your business there?—A. They called me inspector of materials. My duty was to examine and take note of all materials brought upon the premises, and in due time to certify bills therefor.

Witness presented the following statement as part of his testimony:

"Jonathan Wyman, of Crook's Hotel, 84 Chatham street, New York, employed as inspector of materials on the new post office in that city, from September 6, 1869, to May 23, 1870, makes the following allegations:

"On the architect's plans the figures which define the shape of the building are inconsistent and contradictory. On a general plan of the sub-basement the same angle is given, directly or indirectly, as 70° 23′, 70° 22′, and 70° 17½′.

"In the sub-basement the architect's intentions are not realized in his details, the distance between the parallel fronts being too small by 3 inches; and this error of three inches is all put upon the long park front.

"The important pier which forms the corner of west front and Broadway is out of place 2½ inches, and the piers on Broadway 2 inches both ways, giving for offset 6 inches on the right, 2 on the left, 6 inches on the rear, 2 or less on front.

"The blocks of granite for the rough sub-basement, with many vexatious inaccuracies in the schedule, are nearly correct, the schedule for basement correct to course P, though the pier corner of the west front and Broadway does not fit the lot.

"For course P, the blocks were ordered with projections of 4 inches on rear. In March last, when many blocks had been prepared and some delivered, direction was given to remove this projection, or so intended, but really to reduce certain costly blocks to a size quite too small for the third direction, which was sent two months later.

"Courses Q and R, between the sills, were ordered too small by 4 inches on the rear, and a later schedule and plan, correcting this error, abounds in imperfections and inconsistencies, if not errors.

"Iron columns, 32 in number, for the basement front, were ordered 3 inches too long, the floor being lowered to admit them.

"In recent proposals for a large amount of iron work, partial examination of schedule shows a whole set of beams too long by many inches, and two girders near too short by 2½ inches.

"All effort for timely correction of errors has been discouraged."

Q. Is there anything else which you desire to state in order to make your statement complete?—A. That statement which I have read is a mere skeleton. I did not expect that it would be understood without explanation.

Mr. GRISWOLD read to the witness a letter from Mr. Mullett, of which the following is a copy:

"TREASURY DEPARTMENT,
"*Office of Supervising Architect, June* 27, 1870.

"SIR: In the debate of Saturday last, in your House, on the appropriations for public buildings, I notice that statements were made that a lot of iron beams and columns for the New York post office were not suitable for the purpose for which they were intended, and that a large number of iron columns were delivered of improper length.

Please do me the justice to state on the floor that no iron girders or beams have been ordered, made, received, or delivered, and that the only iron columns made or received, namely, thirty-two in number, were of length required by the plans, admirably made, and in every way satisfactory. I have made no changes from my original plans except when the cost of the building could be reduced thereby and in deference to the wishes of your committee that the cost of the building should be reduced to the lowest point.

"Very respectfully,

"A. B. MULLETT,
"*Supervising Architect.*

"Hon. F. C. BEAMAN, *House of Representatives.*"

WITNESS. These iron columns were to take the place of granite, and my criticism is, that the order makes them 3 inches too long for the place. In reference to the beams and girders, the bids were to be opened on the 26th of May, and it was on account of that that I showed, just before that time, the errors which I believed had been made. The error is not in material actually delivered, but in specifications for material.

By the CHAIRMAN:

Q. Are you an architect?—A. I am not.

Q. Have you ever studied the business of an architect?—A. No, sir. I do not pretend that I have.

Q. Have you ever had any experience in building, or superintending the erection of large buildings?—A. No, sir.

Q. Or any experience as a builder or superintendent of buildings at all?—A. I may say no to that. The last year that I was on a farm we were building a brick house, which sent us to the quarry, the brick-yard, and the timber-lot, and for five years I was in the real estate business in New York, where we had constantly to do with buildings.

Q. What position did you occupy in the real estate business?—A. I was general clerk, and occasionally went to examine buildings offered for sale.

Q. Had you anything to do with the erection of buildings during those five years?—A. Not with the erection of any.

Q. Or with the plans for their erection?—A. Sometimes with plans; but I would just as lief give a general negative to your question as to everything that pertains to the architectural art.

Q. You mean that you have no experience whatever either as an architect or builder?—A. Yes, sir.

Q. You speak of the angle in the plan of the sub-basement as being stated differently in different places; will you not state in what connection these different statements of that angle occur?—A. That angle is given as 70° 23′, or within a twentieth part of 23′. Again, on the same plan, it is given by showing the length perpendicularly and base of a right angled triangle, which is the same thing essentially. And then, as a more complicated matter, a certain angle between these same lines is given; and on the very simple principle, that in a triangle the three angles together are equal to two right angles, the figure can be worked out.

Q. In other words, the angle itself is stated in terms as 70° 23′?—A. Yes, sir.

Q. And there are certain elements given elsewhere, which by calculation make you arrive at an angle that is only 70° 22′?—A. Yes, sir.

Q. The angle itself is not stated differently on the plans?—A. I do not recollect as to that.

Q. Do you recollect that angle 70° 23′ to have been stated anywhere on the plans as other than 70° 23′?—A. I do not.

Q. So that it is only by a careful geometrical calculation that you arrive at the fact that that angle must have been only 70° 22′?—A. I would not call it a careful geometrical calculation; it is quite simple.

Q. The calculation that you followed led you to a geometrically accurate result?—A. To an accurate result.

Q. Do you know practically whether, in erecting a building of that size, a difference in the elements of an angle to that slight amount would make a particle of difference?—A. It is not a slight amount.

Q. I ask you whether or not, as a practical question, it makes any difference in the erection of a building of that size, that an angle may be stated in that way of one size, and that the elements from which that angle may be calculated, as you calculated it, may show an angle differing but the amount which you say this difference was, a minute, or a minute and a fraction?

WITNESS. Do you mean to ask me whether I regard the difference as material?

The CHAIRMAN. No, I do not ask you that. I ask you whether you have any practical experience to teach you whether it is material or not?—A. I have not practical experience.

Q. To know whether or not the difference would be material?

WITNESS. I would rather not answer as to the inference.

The CHAIRMAN. I do not ask you for any inferences; I ask you if you have any practical experience from which you can judge whether or not the difference, if it exists, would make any embarrassment in the erection of the building?

A. I have not practical experience. I know, however, that it would make a material difference.

Q. Explain what you mean about the architect's intention as to the sub-basement not being realized in its details, the difference between the parallel fronts being too small by three inches?—A. There are in the office a great many plans, side views, and incidental matters, which show, though not exactly and certainly, where the offsets would be; and these plans will show, I think, unmistakably that there was an intention of having an aggregate difference on the two fronts of at least 7 inches, and I find but 4 inches.

Q. What is the distance between these parallel fronts?—A. Perhaps 225 feet.

Q. How do you arrive at the fact that the distance between these fronts is too small by 3 inches. Is it by measurement, or by careful mathematical calculation?—A. That is theoretical, comparing one plan with the other, and involves also some careful calculation. It is much more complicated than the other.

Q. A careful geometrical calculation is the way in which you arrive at the conclusion that you think the distance is stated 3 inches too small?—A. That the distance is 3 inches less than it ought to be.

Q. Do you know, as a matter of fact, whether any embarrassment has thus far occurred

in the erection of the building from that circumstance?—A. I stated here directly, that the difference of 3 inches ——

Q. I ask you if you know, as a matter of fact, of any embarrassment having arisen in the erection of the building from this supposed error of 3 inches in the plans?—A. If you mean delay in the work, I do not think there has been.

Q. You know of no delay from that circumstance?—A. No, sir. I suppose the mason goes on and lays the blocks as they come. That work is measured, however, and will show for itself.

Q. How do you get at the fact that this important pier at the corner of the west front and Broadway is out of place, as you describe it?—A. By actual measurement.

Q. By measurement on the ground, or by geometrical calculation from the plan?—A. Not by calculation, but by measurement as the piers actually stand. Instead of 4 inches, the regular offset, there are 6½ inches offset. The sub-basement in both directions is too small, and that crowds the foundation too far on the lot. I speak of the building itself as the fixed thing, and the sub-basement as the changeable thing.

Q. Has any one about the building discovered this error besides yourself?—A. I do not know.

Q. Does anybody admit the existence of the error, so far as you know, besides yourself?—A. I have never spoken of it, except to Mr. Hulburd. I asked him to look at it with me, but I think he never did.

Q. The blocks of granite that came to the building, it was your business to receive and receipt for?—A. Undoubtedly.

Q. Had you in your possession a schedule by which to receive them?—A. A schedule was made out. I had much difficulty at first before a schedule was made out. When the granite began to come it was found that there was no schedule.

Q. Was it your business to compare the blocks as they came with the schedule, and to certify their agreement with the schedule, or was it your business simply to measure the blocks and ascertain their size and report their size for payment?—A. It was my duty to examine them, and, in the receipt of all goods, it is the mercantile usage that there shall be a description of the goods, to which the article is expected to conform.

Q. Was it your duty to ascertain and certify that the blocks of granite were correct and according to the schedule put into your hands for the purpose of guiding you, or was it simply to ascertain the cubic quantity of the blocks, and certify and report to the proper authority for payment?—A. I do not know that that question was ever definitely started. I had no doubt that it was my business to see that the blocks agreed with the schedule.

Q. Were you instructed to see that the blocks did agree with the schedule?—A. I called for a schedule, as a matter of course, and was furnished with one after a very inconvenient delay. I do not know that I ever had any authority to see to anything else, except that the material agreed with the schedule. I did understand that the schedule was the description of the material.

Q. When were you instructed as o your duties with reference to these blocks of granite?—A. I do not know that I had any special instructions. A schedule was furnished to me, but not until after I had called for it. I do not know that I had any authority over anything else than that I was to compare the blocks with the schedule.

Q. What were the contents of that schedule?—A. It contained general headings, "what ront, what pier, what length, what width, what thickness, and how many pieces." The stones were marked for the front and for the pier, and then were defined by length, breadth, and thickness.

Q. Were the stones numbered to agree with numbers in the schedule, so that you knew what dimensions a particular stone was intended to fill?—A. They were, very much, although the marking was likely to be defaced. The real reliance was the knowledge of the dimensions in the schedule, and then the actual dimensions by measurement.

Q. How large a part of this stone had been received before you received the schedule that you speak of?—A. The first lot that came in proved to be a very small lot, some fifty blocks, I presume, and no more than that came until the schedule was furnished.

Q. You say the pier at the corner of west front and Broadway does not fill the lot; what do you mean by that?—A. That is not a matter of schedule, but is a matter of fact. I do not see how it could arise from the architect's plan. It seems as if it must be a mistake of the contractor or builder. The pier does not fit the line. In reality it runs over a little.

Q. How much does it run over?—A. There are two ways of determining that. My impression is, half an inch in the size of the pier.

Q. Is the pier half an inch too small or out of place?—A. It is a corner pier, and the mason has set it on the line on one side, and running over the line on the other side. It is fitted for too large a corner. It runs half an inch over the line in 8 feet. That would be one inch in 16 feet, two inches in 32 feet, and so on.

Q. I do not understand that the line has been followed in that way?—A. I do not say that that error comes out of the architect's plan. It is one of the imperfections of the work.

Q. The blocks of granite that you speak of, where were they prepared; at New York, or at the quarry?—A. At the quarry at Dick's Island.

Q. Have you been there yourself?—A. I never have been there.

Q. What knowledge have you of the number of blocks prepared there, before directions were given to change the piers?—A. The architect required of the agent there, before giving the order for the change, a statement, which was in the office at New York, and of which I have a copy.

Q. As to this projection which you speak of occurring, both on the inner and outer sides of the wall, the only use that you could discover for it was for the projection on the outer side, as I understand?—A. The use of that is evident.

Q. That is to support the sidewalk, as I understand?—A. I understand it to be so.

Q. Might there not have been some architectural or practical advantage, also, in the projection on the inner side, of which you are not aware?—A. There may have been.

Q. You do not know whether or not that was useful, or according to architectural rules?—A. That is the fact.

Q. Have you any knowledge on the subject that enables you to speak decidedly as to whether or not that projection in that place has a practical value?—A. I am not an architect, if that is a satisfactory answer.

Q. I want to know whether or not you have such an acquaintance with the subject as to enable you to speak certainly as to whether it had or had not utility?—A. It was always a matter of wonder to me. I conned and conned, and examined it. The specifications were correct. They were nicely done; but still, why the projection was there at all, was a constant wonder to me, and afterward directions were given to take it off.

Q. With the exception of the comparison of the blocks of granite with the schedule, was there any part of these matters, with reference to which you found fault, that was within the duties assigned to you at that building?—A. That is, in part, a matter of opinion. I do suppose that it was my duty to know that the material that came there was of specified size, and of satisfactory size.

By Mr. ELA:

Q. What is the increased ratio of the cost of the stone as its size is increased?—A. I understood that it is one cent additional for every foot above 20 cubic feet.

Q. And the only change you knew in relation to the stone, was a change of plan to reduce the size of the stone?—A. A letter came with directions and explanation to remove that projection.

By the CHAIRMAN:

Q. In the last part of this statement, you say, "In recent proposals for a large amount of iron-work, partial examination of schedule shows a whole set of beams too long by many inches, and two girders near too short by two and a half inches." Was any part of that iron delivered while you were at the building?—A. No, sir; it would not be ready for a long time. I do not know that the contract is actually given. The proposals were to be opened on the 26th of May, but what was done afterward I do not know.

Q. How did you arrive at the fact that the set of beams mentioned in these proposals were too long for the place for which they were designed?—A. By taking the schedule and measuring the places on the ground—by actual measurement, telling from the schedule the point which would determine one end. It is actual measurement and no calculation.

Q. Can you describe what beams these were that were too long?—A. Yes, sir; for, strangely, the errors center about a certain part. They were the beams which lay alongside these iron columns in the sub-basement front, which extended from a certain girder out under the sidewalk to the area of the wall.

Q. Where were these girders to go that were too short by 2½ inches?—A. On the Broadway front; beginning at the door of Mr. Hulburd's office, and counting down the Broadway row of piers, it is the third column that is out of place, and the length of the girder depends upon it. I am not quite sure that it is at the left, which would make it shorter, or at the right, which would make it longer; but I can state definitely that beginning at the Park front it is the third column that is 2½ inches out of place.

By Mr. GRISWOLD:

Q. Is it out of line with the other columns?—A. It never would be set out of line. The man who was putting it up would never place it in that way: but the length of girder is not right. The column would stand on a line with the others, but its distance from the other columns is 2½ inches more than the girder.

Q. Then something has got to be done with the girder to keep the column in line?—A. Yes.

By Mr. ELA:

Q. You stated somewhere in conversation that these 32 columns were too long, and that the granite had been altered to receive those columns?—A. These columns were to take the place of certain small granite pillars. The size of the basement, including the P course, is seven courses, and these courses are of uniform thickness, 20½ inches. The length of these columns standing on one course of the seven, was 3 inches more than the thickness of the six courses, and directions were actually sent to the quarry to cut down that one course

(course G) by 3 inches, so as to let in these columns and their plates. So that, instead of 20½, they were cut down to 17½ inches.

By Mr. GRISWOLD:

Q. Was the granite cut down at the bottom of the columns or at the top?—A. At the bottom. I myself detected that. It was reported to Washington. It was a thing that concerned me, and I detected it. When the letter came back from Washington the answer was shown to me, and in that letter directions were given to cut down these pieces and make them 17½ inches instead of 20½. The schedule in the office makes them 20½, and the direction was to cut them down to 17½ inches.

Q. How much does this P course project over the course below?—A. Four inches.

By the CHAIRMAN:

Q. Was there any cutting down of the stone, or was it only a cutting down in the plan?—A. It would have been cut down in the plan if made in time, but the plan was changed after the stone was cut. Some of it was done on the ground at New York, and I understood that it was done also at the quarry with the blocks that were not delivered but prepared. I mean that 4 inches were actually cut off from the size of the stone.

Q. In how many stones did that occur?—A. I have not the schedule and cannot answer very definitely. I think there were 13 on the ground. A couple of small ones were thrown aside and could not be used at all; two others were broken up. I remember one large pier on which four of these stones went, with some alterations, and not quite right at that. The P course in the middle pier was made wrong in one direction by the contractor, and in another direction by the mason. That is a matter of feet and inches which need not rest on my assertion at all. Where there are different parties, the office in Washington, the execution in New York, and the preparation of the materials at the quarry, if errors are started it is wonderful how they multiply; and that pier in the basement is a good illustration of it. The measurement is 6 feet 4¼ inches. The direction of the plan in the office in New York is 5 feet 6½ inches, a difference of nearly 10 inches; and on that corner it is too small by about 2 inches, and on that line too small by a foot and a half.

By Mr. ELA:

Q. What is the size of this piece of granite that was cut down a foot and a half?—A Some 10 feet long and 4 or 5 feet wide. These corner piers are the massive piers of the building. I do not see how that piece of granite, if actually too small, can be worth 10 per cent. of its cost. It is five-sided, with one side a curve.

Q. Where is the granite to be delivered, under the contract?—A. As called for on the site in New York. There is a clause in the contract which says that the contractor shall cut it as required.

Q. Who has to make the requirement?—A. The architect or the Secretary of the Treasury.

Q. Then the granite is delivered wherever the architect chooses to order it?—A. Yes.

Q. Was there any stone cut in New York?—A. None of it dressed. Sometimes a piece that did not fit its place, or serve the purpose for which it was intended, was cut up for something else.

Q. You had no rough stone brought and dressed there?—A. No, sir.

Q. What is the letter of that pier to which you refer as not fitting its place?—A. Pier E, corner of Broadway and west front.

WASHINGTON, D. C., *February* 13, 1871.

RICHARD DUNBAR sworn and examined.

By Mr. CHURCHILL:

Question. Where do you reside?—Answer. I am at present residing in Washington City. My home is at Brooklyn, New York.

Q. What is your occupation?—A. I am a contractor by occupation.

Q. Were you one of the bidders under the advertisements published last summer for proposals for the completion of the custom-house and post office at St. Paul, Minnesota?—A. I was.

Q. What was your proposal for?—A. For the completion of the whole building; to do all the work necessary to be done to complete the building according to the plans and specifications of the supervising architect.

Q. What was the amount of your bid?—A. Ninety-six thousand five hundred and eighteen dollars and forty-six cents.

The bid was put in evidence as follows:

"*Proposals for the completion of the United States custom-house at St. Paul, Minnesota.*

"_____ _____, 187-.

"_____ _____ hereby propose to furnish all the material and do all of the work necessary to complete the custom-house building at St. Paul, Minnesota, in accordance

with the several plans (numbered from 1 to 57 inclusive, and making in all fifty-eight drawings) and the specifications, and also in conformity with the terms of the following advertisement:

"'ADVERTISEMENT.

"'Sealed proposals will be received at this office until ———, at 12 o'clock m., for the completion of the custom-house building at St. Paul, Minnesota, according to the plans and specifications on file at this office.

"'The cut granite necessary to complete the exterior of the building, including the outer steps, will be furnished to the contractor by the Department at or near the stone-cutters' sheds in the vicinity of the building. The brick, plate-glass, mantels, and grates, locks and trimmings, and chandeliers will also be furnished to the contractor by the Department, delivered at the site of the building. The shops, sheds, tools, derricks, and other machinery, together with all material belonging to the Government, including the limestone, sand, iron, steel, tools, implements, &c., that have been previously purchased for use in the construction of the building, will become the property of the successful bidder. Schedules of this property can be seen at this office, and the articles will be received by the contractor in the location where they are stored. No allowance for hauling or transportation will be made by the Government.

"'The limestone facings must be of the same quality and in every respect equal to that already in the building.

"'The entire masonry must be of equal quality and workmanship in every respect to the work already performed.

"'Payments to be made monthly on the certificate of the superintendent. Ten per cent. of the estimated value of the work performed to be retained until the completion of the contract.

"'All bids must be accompanied by a penal bond in the sum of ten thousand dollars, that the bidder will accept and perform the contract if awarded to him. The sufficiency of the security to be certified to by the district attorney of the district in which he resides.

"'The Department reserves the right to reject any or all bids, and any bid that is not made on the printed form to be obtained at this office, and which does not conform in every respect to the requirements of this advertisement, will not be considered. The work will not be subdivided among different bidders, but will be considered in the aggregate only.

"'A. F. KNIGHT, *Superintendent.*'"

For masons' work	$34,456 85
For carpentry and joinery	27,319 30
For iron-work	16,659 31
For roofing	3,534 00
For plastering	8,489 00
For plumbing and gas-fitting	1,815 00
For painting and glazing	4,245 00
Being for the whole work complete, the sum of	96,518 46

for which amount ——— will accept the contract.

———, ———,
Contractor.

Inside steps also to be supplied.

"*Guarantee bond.*

"For value received, we, the undersigned, hereby guarantee the proposal of ——— ———, ——— ———, and bind ourselves to the United States in the sum of ——— dollars, to be paid in liquidated damages in the event of the failure of the bidder to execute a contract agreeably to ——— proposal, with two good and sufficient sureties, (to be approved by the Secretary of the Treasury,) within ten days after the said Secretary shall have given written notice that the proposal, in whole or in part, is accepted, and that the contracts are ready to be executed.

"——— ———. [L. S.]
"——— ———. [L. S.]

"OFFICE OF THE ———,
"———, ———, A. D. 1870.

"I hereby certify that ——— ———, the sureties who have signed the foregoing guarantee, are known to me as residents of ———, and citizens of the United States, and that I believe them to be amply sufficient security for the amount thereof, and that the guarantee is good.

"——— ———."

Q. Where were the bids opened?—A. They were opened in St. Paul. Here is Mr. Mullett's letter advising me of the result.

Q. Do you recollect at what time the bids were to be opened?—A. I think on the 4th of June.

Witness presents the following letter received by him from the Supervising Architect:

"TREASURY DEPARTMENT, OFFICE OF SUPERVISING ARCHITECT,
"*June* 10, 1871.

"SIR: Yours of the 9th instant is received. In reply I have to say that the bids for the completion of the custom-house at St. Paul, Minnesota, have this day been received, and that you are the lowest bidder. The amount of your bid, however, would make the cost of the building so much above the limit fixed by law, that it is impossible to accept it or take any action in the matter until further legislation is had.

"Very respectfully,

"A. B. MULLETT,
"*Supervising Architect.*

"RICHARD DUNBAR, Esq.,
"*Astor House, New York.*"

Q. What was your letter of the 9th, referred to in that letter of Mr. Mullett's?—A. A letter asking him whether he had heard from St. Paul as to the result of the proposals.

Q. Was your bid sent to St. Paul?—A. Yes.

Q. And was opened there with the other bids?—A. Yes.

Q. Have you any other letter relating to the matter?—A. Yes, I have a letter from Mr. Knight, the superintendent at St. Paul, dated 16th January, 1871.

The letter was put in evidence, as follows:

"ST. PAUL, MINNESOTA, *January* 16, 1871.

"SIR: In compliance with instructions from the Supervising Architect, I have to inform you that the Secretary of the Treasury has decided to reject all the proposals received on or before June 4, 1870, for the completion of the custom-house and post office at this place.

"Very respectfully,

"A. F. KNIGHT,
"*Superintendent United States Custom-house.*

"RICHARD DUNBAR, Esq.,
"*Washington, D. C.*"

Q. Do you know how much your bid, if it had been accepted, would have made the cost of the building exceed the limit fixed by law?—A. I understood then at the office that it would amount to $17,000 over the amount appropriated.

Q. Did you have any conversation with Mr. Mullett intermediate the two letters that you have presented?—A. Very often.

Q. State what those conversations were.—A. He gave me a list of the other four bidders, and he said that there was a gentleman in this city from St. Paul who was a bidder, and who wanted to see me very much. His name was Mr. Wilder, and he was stopping at the National Hotel. Mr. Mullett gave me a card, introducing me to Mr. Wilder; he told me to go and see him. I met Mr. Wilder and another gentleman, named Sherrill, and I handed Mr. Wilder the card which Mr. Mullett had given me, and he invited me up to his room, where we talked the matter over as to the proposals.

By Mr. FARNSWORTH:

Q. Who were the other bidders beside yourself?—A. I cannot name them now. Mr. Wilder was one, and he made me a proposition, asking me if I would sell my bid.

By Mr. GRISWOLD:

Q. This conversation was after the bids had gone in?—A. Yes, sir.

By Mr. CHURCHILL:

Q. And after Mr. Mullett's letter of the 10th to you?—A. Yes. I remember that Mr. Wilder called my attention to the fact of receiving a letter from Mr. Mullett. It was therefore after the result was reported.

Q. Give the conversation as it occurred between you and Mr. Wilder.—A. Mr. Wilder made a proposition to me that he would give me a couple of thousand dollars if I would withdraw my bid. He said that my bid was the lowest, and that he thought it was what they call a fly bid; that it was sent in purposely by Mr. Mullett to annoy him. I told him that I was an old contractor of twenty-five years' standing, and that I had made my proposal in good faith and could not sell it; that I was aware of what I did, and was willing to abide by it. He said that it was too low, and that, if he could get me out of the way, there was another man between me and him whom he

could get out of the way very readily, and get the contract for himself. He said that he had not made the figures himself, but that the architect had given him the figures, and that he had added fifteen per cent. to them. I told him that I had itemised my bid and knew what I was about.

By Mr. FARNSWORTH:

Q. Is he the man who is furnishing the material for that building?—A. Yes, he is furnishing the granite.

Q. State whether Mr. Mullett advised you that your bid was too low.—A. He did. During the intermediate time, from the 10th of June up to the 16th of January, he always insisted that my bid was too low, and that I could not execute it. He then insisted upon my going to St. Paul. Afterward I went to Mr. Mullett and told him that I was ready to go to St. Paul if he would give me a letter of introduction to Mr. Knight. He told me to wait for a few days, and immediately afterward he started for New Orleans. In the mean time I received that letter from Mr. Knight.

Q. He told you that before you went to see Mr. Wilder?—A. Yes; he always told me that my bid was too low.

Q. He told you that Mr. Wilder wanted to see you?—A. Yes.

Q. He gave you a card as a note of introduction to Mr. Wilder?—A. Yes.

Q. Had Mr. Wilder any other business with you at that time than to try to buy you off?—A. That was his only business with me.

Q. State whether, after you received this last letter from St. Paul declining all the bids, you informed the Secretary of the Treasury of what you have just stated to the committee?—A. After I had received the letter from St. Paul, I took it up to the Secretary of the Treasury; I told him I was very much astonished at the purport of the letter, and wanted to know why my proposal was rejected; he said it was on the ground that the Government could do the work itself for less, or something to that purport.

By Mr. CHURCHILL:

Q. Did you not know by the letter of 10th of June that there was a reason in law which might be the objection?—A. I was aware of that, but I was in hopes that an appropriation would be made, and that I, being the lowest bidder, would get the contract. Mr. Boutwell told me that the only reason was that the Department thought it could do the work cheaper; I said that I was aware that I had to fight a powerful ring; he said something about not being aware of a ring; I told him that there was one, and then I stated to him about Mr. Mullett's handing me the card for Mr. Wilder, introducing me to a gentleman connected with the work, and who made me the proposition to pay me so much money if I would withdraw my bid; I said that I would not like to say any more on the subject until Mr. Mullett came back, and that then I would like to have a conference with Mr. Boutwell in Mr. Mullett's presence; Mr. Boutwell said very well. After Mr. Mullett's return I went to see him at his office; he came to me, and asked me if I had told anybody that he had given me a letter to get somebody to buy up my proposal; I said, "Not as you say it." Then he said, "Then you deny it?" I said, "I do not deny what I said." He asked me, "Did you say so and so?" I said, "Not as you say it, but I said that you gave me a card introducing me to a man who made me a proposition to buy my bid." He then said, "You are a liar," and he struck me with his fist on the cheek, cutting a gash in my face; I got hold of him and got him down in the chair, but his clerks caught hold of me, and saved him for the time being.

Q. Did you have any further conversation with the Secretary of the Treasury on the subject?—A. I went to the Secretary after that and told him that I had not expected to meet a pugilist when I went on business into his office; the Secretary said that it was rather unfortunate for both of us. That was all he said in the matter.

By Mr. FARNSWORTH:

Q. How much higher was Mr. Wilder's bid than yours?—A. I cannot give the exact figures, but it was at least $20,000 or $25,000 more than mine; he told me that the man who bid next lowest to my bid was not a very responsible man, and that all that he wanted to get out of the way was me.

Q. Have you been a contractor for the Government in Washington?—A. Yes; I was connected with the aqueduct here from April, 1863, to 1866, I think.

Q. Do you know anything about the Morris Mining Company of Colorado, or the American Mining Company?—A. I know something about the Morris Mining Company. After I had made my proposal for the St. Paul work a gentleman named Thorpe came to me and represented himself as a friend to Mr. Mullett; he introduced me to Mr. Mullett and talked to Mr. Mullett; Mr. Mullett said that any arrangement I would make, or anything I would do, with Mr. Thorpe, he should abide by and stand by; he said that he, Mr. Mullett, was the treasurer of the Morris Mining Company. After we left Mr. Mullett's, we went down to the hotel, and Mr. Thorpe gave me to understand

that he had everything to do in the matter. In a few days afterward he gave me $5,000 of stock of the Morris Mining Company made out in my name.

Q. For what purpose?—A. To pay for it, or to negotiate it.

Q. What did you do with the stock?—A. I kept it for nearly two months and then transferred it back to him again. He saw that I was not negotiating it or paying for it, and he was anxious to get it back, so I transferred it back to him.

Q. State whether anything was said to you about contractors or persons in the employment of the Government being expected to take that mining stock. Was anything said on that subject either by Mr. Mullett or Mr. Thorpe?—A. There was nothing said about it by Mr. Mullett, but Mr. Thorpe said that it was customary to negotiate for that stock with contractors and people doing work.

Q. Did he state how much the capital of the company was?—A. I forget whether he stated the amount or not, but I know from seeing the papers that the capital stock of the Morris Mining Company was $2,000,000, and of the American Company $600,000.

Q. Do you know who was the treasurer of the Morris Mining Company?—A. Mr. Mullett himself told me that he was the treasurer of both companies.

Q. Did you learn from Mr. Thorpe who else connected with the Government buildings, if anybody, had taken stock?—A. He told me that there was a man appointed superintendent, and that he was to negotiate the stock.

Q. Did he say anything about the post office building in New York?—A. He said that there was a good deal of stock negotiated at the New York post office building, and that Mr. Mullett was highly pleased with the result. He did not give me the name of the man there who negotiated it.

Q. Mr. Thorpe had no other business with you than that?—A. No, sir.

Q. And Mr. Mullett told you that any arrangement you made with Mr. Thorpe would be all right?—A. Yes; he told me so. Mr. Thorpe gave me to understand that, if I should negotiate this stock, I could accomplish anything and do anything I had a mind to; that anything I wanted done would be done, and that everything would go on as I wanted it.

By Mr. CHURCHILL:

Q. How long have you been acquainted with Mr. Thorpe?—A. I saw Mr. Thorpe for the first time three or four years ago. I never had much acquaintance with him.

Q. When did you first have a conversation with him in regard to the Morris Mining Company?—A. It was after I had made my proposal for this work; I could not state the month; I think it was in the latter part of June or July. It was in this city. I was stopping at Willard's Hotel, and he came to me there and brought me to Mr. Mullett's office.

Q. Were any persons in New York named as having taken any of the stock of either of those companies?—A. Mr. Thorpe did not give the names of the parties who had taken it. He said that the stock was negotiated there at the new post office building, and that Mr. Mullett was highly pleased with the result of the negotiation there. Mr. Thorpe used to have an office in Four-and-a-half street, in this city.

By Mr. MUZZY, counsel for Mr. Mullett:

Q. What were the requirements as to the furnishing of bonds on the part of the bidders?—A. The requirements were to furnish a bond of $10,000. I furnished such a bond, with General Hiram Walbridge, recently deceased, as my bondsman. Mr. Mullett said it was satisfactory. The bond was certified to by District Attorney Fisher. General Walbridge died last December.

Q. He was the only guarantee?—A. He was the only guarantee, and Mr. Mullett said that he was satisfied.

Q. To whom besides Mr. Wilder did you offer to sell your bid?—A. Not to anybody; and I did not offer to sell it to Mr. Wilder.

Q. Are you positive that you did not offer it to Mr. Wilder?—A. I am.

Q. Or to anybody else?—A. No, sir; never. Mr. Wilder is the only man that ever spoke to me about it.

Q. Did you ever offer to sell to Evan & Teemyer?—A. No, sir.

Q. Did you ever offer to sell it to Theodore Adams?—A. No, sir. I had conversations frequently with Mr. Evan and Mr. Teemyer, and said that I would take them into partnership with me in the concern, but I did not say that I would sell to them, and they never offered anything of the kind to me.

Q. Do you know where Mr. Thorpe is at present?—A. No, sir.

Q. Do you know what relations he holds to this mining company at present?—A. No, sir.

Q. How many conversations did you have with Mr. Wilder about the matter of the contract?—A. The first conversation that I had with Mr. Wilder was the time that I came with Mr. Mullett's card to him, and I met him probably once or twice after that.

Q. And you are quite positive that in all of these conversations he offered to buy you out?—A. He offered to buy me out the first time.

Q. What was the conversation about afterward?—A. We were talking about the work, and I requested that if I should go to St. Paul to do the work, he would not be prejudiced against me on account of my not selling to him. He said that he would not; that he would be a good neighbor, &c.

Q. Do you know the highest bid that was put in for the work?—A. I do not. There were about five bids put in.

By Mr. CHURCHILL:

Q. The only offer that Mr. Wilder made to you was an offer of $2,000?—A. He did not say the precise sum; he said a couple of thousand dollars.

Q. He made you that definite offer if you would sell out or withdraw your bid?—A. If I would withdraw my bid. He said that I had a perfect right to withdraw it, because it was not binding on me; but I told him that I would hold on to it.

Q. Was there any condition annexed to his offer; that is, that he would pay you so much if he afterward succeeded in getting the contract himself, or was his offer an absolute one that he would pay you so much if you would withdraw your bid?—A. I think it was an absolute one, that he would pay me so much if I would withdraw my bid.

Q. Did you see Mr. Mullett after that conversation with Mr. Wilder, and have any conversation with him in regard to the interview between yourself and Mr. Wilder?—A. I did not tell Mr. Mullett the precise words that passed between Mr. Wilder and myself.

Q. Did you tell him of Wilder's having made any offer to you?—A. No, I do not think I made mention of it to him.

By Mr. FARNSWORTH:

Q. You are certain that Mr. Mullett repeatedly said to you that your bid was too low?—A. He did repeatedly, during the summer and fall. He always told me that my bid was too low, and he also said that he would enter a protest against me, if I fell short, and that I should get no extras. When I supposed there would be an appropriation made to finish the work, I went to Mr. Mullett and told him that I was ready to go to St. Paul, and asked him to give me a letter to Mr. Knight. He said that I had better wait another while.

Q. What do you mean by his entering a protest?—A. That, if there was a contract entered into with me, he would file a letter in the Department that, if I fell short in completing the building, I should not afterward have any extra allowances; in other words, that he would hold me to the contract.

Q. What was your opinion as to your bid being too low?—A. I was satisfied with my bid. When I made that proposition I did not expect to get the contract, because I thought the bid too high. The figures there are good liberal prices for a contractor, in my opinion.

Q. You are satisfied that you could make money by the job?—A. Yes, I think I could make a good living price out of it.

By Mr. GRISWOLD:

Q. You are not willing to sell for $2,000?—A. No, I would not sell for $10,000, because I expected to realize a very good profit from it for my time and labor.

By Mr. CHURCHILL:

Q. Do you know of anything further that might throw light upon this inquiry?—A. Nothing further.

WASHINGTON, D. C., *February* 15, 1871.

A. B. MULLETT recalled.

By the CHAIRMAN:

Question. Were advertisements published after the close of last session of Congress, asking proposals for the completion of the St. Paul custom-house?—Answer. Before the close of last session, in consequence, perhaps, of an impression that I was a little extravagant, or in consequence of that charge having been made, a proviso was attached to the appropriation for the St. Paul custom-house, that no more money should be expended until a contract were made limiting the total cost to $300,000, which reduced the cost of the building over $70,000 below our estimates. We advertised for proposals in the St. Paul papers. I hand to the committee an abstract of the bids received:

John Green, Stillwater, Minnesota	$129,580 00
G. W. & A. P. Merrill, St. Paul, Minnesota	138,500 00
Leonard & Stein, St. Paul, Minnesota	128,000 00
A. H. Wilder, St. Paul, Minnesota	136,776 34
F. H. Grindall & Co., St. Paul, Minnesota	110,437 00
Richard Dunbar, Washington, D. C	96,513 46

Mr. Dunbar was the only bidder who had not examined the building in its present condition, and taken an inventory of the materials on hand. He based his bid entirely on the photographs which he saw in our office, and on such information as we could give him. All the other bidders had inspected and examined the work themselves.

Q. When were these bids opened?—A. On the 4th of June, 1870.

Q. Had you any interview with Mr. Dunbar in reference to his bid, after it was opened and before the 10th of June?—A. He was in the office every day and almost bored me to death. He seemed to be part of the office furniture. He would plant himself at my desk, and sit there for hours at a time. He became a first-class nuisance. I told him (and a letter was written him to the same effect) that it was impossible to do anything in the matter, as none of the bids came within the restriction of the law as to the total amount. He said he had sufficient influence in Congress to effect the repeal of that proviso; and he asked me if his bid would then be considered. I told him I could not answer for the Secretary of the Treasury, but that I would submit it to the Secretary for consideration. I told him, however, that I intended to recommend the Secretary to take no action on it at all until he (Dunbar) had been to St. Paul and examined the condition of the building and the materials on hand, and filed a written statement that he fully understood the situation and was willing to stand by his bid; and that in that case I should make no objection. I did not know anything about Mr. Dunbar except that he had been introduced to me by Senator Carpenter as an applicant for the position of superintendent. He had only one bondsman on his bid, although the advertisement required two.

Q. Was any objection made to the bid on that ground?—A. No. I told the Secretary that I thought General Walbridge, who was on the bid as a bondsman, was good for that amount. My impression was, from the first, that Mr. Dunbar's only object was to get a claim upon the Government.

Q. Did you have any conversation with Mr. Dunbar, in which you referred him to Mr. Wilder, of St. Paul?—A. Mr. Dunbar came to me and asked that the bids should not be definitely rejected, but should be left until the end of the session of Congress. He said he could satisfy me of his responsibility, and that he had a sufficient number of friends in Congress to have the proviso repealed; in which case it was understood that the Secretary would take the matter up and take such action as he saw fit. I told him that I knew that Senator Ramsay was anxious to have the work go ahead, and that Mr. Wilder was here trying to satisfy the committee that his bid was right, and that it would be probably well to see what steps the Minnesota delegation was going to take. I gave him an introduction to Mr. Wilder because they were both interested in obtaining a repeal of the proviso. Mr. Dunbar's bid was the only one that came below the office estimates. All the others were above them. Taking Mr. Dunbar's bid, the cost of the building would have been $61,656 81 beyond the $300,000 limit fixed by law.

Witness presented to the committee the following paper, compiled in his office:

Estimate of amounts expended and due June 1, 1870, and of sums required to complete the building.

Expended	$159,000 00
Due Mr. Wilder for granite cutting	47,312 64
Estimate to complete granite cutting	9,619 31
Due R. Delano, (contractors' stock)	6,084 55
Granite wanted	2,852 85
Estimated cost of cutting inside steps	8,000 00
Other liabilities, (estimated)	10,000 00
Brick	7,074 00
Plate glass	3,500 00
Mantels and grates	5,600 00
Trimmings to doors, &c	600 00
Superintendence, &c	5,500 00
	265,143 35
R. Dunbar's bid for completion	96,513 46
	361,656 81
Appropriated	$200,000 00
Expended for site	16,000 00
For building purposes	184,000 00
	361,656 81
Required to complete in addition to amount already appropriated	177,656 81

Amount estimated as per report to committee January 3, 1870	$378,462 00
Amount of superintendent's estimate October 1, 1869	378,898 78
Highest bid	138,500 00
Lowest bid	96,513 46
To complete by Dunbar's contract	361,656 81
To complete by highest bid	403,643 35
To complete by superintendent's estimate	378,898 78
To complete by office estimate	378,462 00
Average of above estimates	380,665 23
Average of bids submitted	123,301 13

Q. How much was Mr. Dunbar's bid below the office estimate?—A. The office estimate was $78,462, and Dunbar's bid was $61,656 81—$16,805 19 less than the estimate.

Q. When was the office estimate made?—A. It was revised on January 3, 1870, to be transmitted to the Committee on Appropriations.

Q. Do you know how many interviews Mr. Dunbar had with Mr. Wilder?—A. I do not know anything about them.

Q. After his interview with Mr. Wilder did he communicate to you what had taken place?—A. I do not know what he said; but he never said anything to lead me to imagine for a moment that he had been negotiating with Wilder about withdrawing his bid. If he had I would have immediately recommended the Secretary to cancel his bid. There has been no instance since my connection with the office in which any bidder was permitted to withdraw his bid or to sell his bid. In fact, such a thing is positively forbidden by the regulations of the Department.

Q. Had Mr. Wilder intimated to you a desire on his part to see Mr. Dunbar?—A. No, sir; Wilder has stated emphatically that the work could not be done at less than his bid, and that he would not take it at less.

Q. How much was Wilder's bid above the office estimate?—A. About $23,437. There were no bids that came below the office estimate except Mr. Dunbar's and Mr. Grindall's, and these were the only two bids that could have been considered had the proviso been repealed.

Q. How many bids stood between Dunbar's and Wilder's?—A. Three. Wilder was the highest but one. I think that Wilder's was inadmissible under any circumstances. It was a very high bid, although I do not believe it was anything more than would allow a fair profit to the contractor.

Q. Do you know the Morris Mining Company?—A. I have the misfortune to know something about it. I am treasurer of the company, and have my notes out to carry the thing along.

Q. When was that company organized?—A. Fifteen or sixteen months ago.

Q. Do you know Mr. Thorpe connected with it?—A. Yes, Mr. William Thorpe. Dr. Kane came on here from Colorado, either as the owner or the representative of the owner of the property, and I understood that he employed Mr. Thorpe to find some parties here who would go into it. At first, I did not care about going into it; I did not think I had any time to attend to it, and I did not like to run any risk. Finally I went up and asked the Secretary of the Treasury if he saw any impropriety about it. He said that it was a private matter entirely, and that he had no advice to offer; but he had no objection, and I concluded to go into it, as I thought there was a prospect of making a little out of it.

Q. What amount of stock have you?—A. I had one hundred shares originally, and I have the same amount now. I have neither bought nor sold.

Q. What was the par value?—A. One hundred dollars a share.

Q. What was the amount of the capital stock?—A. Six hundred thousand dollars.

Q. Did Mr. Thorpe ever call on you with Mr. Dunbar?—A. I am not positive. My impression is that he did. I know that he made a proposition that Mr. Dunbar should sell stock for us, which I refused to consent to. I would not trust either Mr. Thorpe or Mr. Dunbar with the stock of the company. Neither of them ever had any of the company's stock in his hands.

Q. What time did you see them?—A. I do not know. My first introduction to Dunbar was through Senator Carpenter. He came as an applicant for any kind of superintendency under the Department. This was four or five months before any thing came up about the St. Paul custom-house.

Q. How much stock of the Morris Mining Company did Thorpe hold?—A. I do not recollect. He was a stockholder.

Q. Was he a director in the company?—A. He was at that time.

By Mr. MUSSEY:

Q. Is he now?—A. No, sir; he resigned in consequence of action which I took in the meeting. I found that he was lying in every direction. He would tell one man that the stock was 75 cents on the dollar, and he would tell another that it was 50 cents, when, at the same time, the company was only asking 35 cents for the stock.

In fact, he told so many lies that we could not sell any stock. He could not tell the same lie twice.

By the CHAIRMAN:

Q. Did you ever say to Mr. Dunbar that any arrangement he might make with Thorpe would be all right?—A. I never talked directly or indirectly to Mr. Dunbar about the business of that company, except to say that I would not have anything to do with it; that any arrangement he might make with Thorpe would be about Thorpe's own stock.

Q. Had Mr. Thorpe paid anything into the company?—No, sir; the stock he held he received for organizing the company, as I understood. Dr. Kane told me that Thorpe had deceived him, and that he had given Thorpe a certain amount of stock to organize the company.

Q. With reference to Mr. Dunbar, did you not understand that he was an old contractor?—A. Yes, sir; I understood he was an old contractor.

Q. And that he had been in that business a great many years?—A. Yes.

Q. And you considered his surety entirely sufficient?—A. I considered General Walbridge's security sufficient for any reasonable amount.

Q. Then why should there be any such hesitation about taking the bid?—A. The difficulty was on the restriction in the law. If that difficulty had been got rid of there would have been no objection, except so far as to require him to go to St. Paul and see the work, so that he would have no excuse afterward to make a claim. No man could bid honestly on a work of that kind without seeing it.

Q. Could not inquiries be made?—A. There were no data in the office to supply the information. If it were to erect a building *de novo* a man could bid upon it; but as it was to complete a building, no man could bid properly on it without examining the work and the materials on hand.

Q. If Mr. Dunbar, an old contractor, and having a responsible surety, was willing to take the responsibility, why should there be any hesitation at the office about it?—A. Last session Congress passed a bill relieving Captain H. Grant from a contract for a building at Norfolk on precisely that excuse—that he was sick at the time and not competent to examine the plans. I did not propose to give Mr. Dunbar any loophole for extras. That has been the universal practice of the office.

By Mr. MUSSEY:

Q. Can you mention any recent cases?—A. Yes, the cases of the contracts for the marble work and granite work on the Portland court-house. Both of these contracts were taken too low, and the contractors made claims. I told them at the time that the bids were too low; that I would be very glad to have them sign the contracts, but that I wished them to understand that they could not come back on the office for allowances.

By Mr. GRISWOLD:

Q. You are obliged by law to accept the lowest bid?—A. I have nothing to do with it. I make my report to the Secretary of the Treasury. We always take the lowest bids, but when we consider them too low we have always placed them on record as taking the contract at a rate which the office considered too low.

By Mr. ELA:

Q. Do not the photographs and the monthly returns in your office show the exact state of the work?—A. The photographs show the outer walls, but not the interior of the work nor the amount of materials on hand.

Q. Would not the superintendent's report show the exact amount of the materials on hand?—A. Yes; but it would not show the amount of work necessary to be done.

Q. Does not the monthly statement show the exact condition of the interior work, which the photographs do not show?—A. It shows it to us, but we have no right to exhibit our computation to others.

Q. Does not the monthly statement show the amount of material on hand just as well as if the bidders were on the ground to see it?—A. No, sir; the bidders might claim afterward that the information was false.

Q. Was there anything which a bidder would need to be informed about, which your plans did not show him, except the amount of stone got out ready to be put into the building?—A. Yes, sir.

Q. What else in the way of materials would he need to learn about?—A. I have tried to answer that question. We could not give him the exact condition of the building any further than as it was shown by the photographs. A man with the greatest care in the world might readily make a great mistake unless he examined the work and materials on the ground. Mr. Dunbar's bid exhibited so great a discrepancy that I told the Secretary, and the Secretary concurred with me, that Mr. Dunbar should go and look at the work and say that he was willing to take it at his bid before the contract was awarded to him.

Q. Your photographs show the exact condition of the outside of the building?—A. Yes, sir.

Q. And would not the interior work necessarily go on in the same proportion?—A. Not at all. The exterior walls might be put up without any of the interior work being built.

Q. What else was there on the ground, except the limestone, which the Government was to furnish?—A. There were brick in the iron beams, if my memory is correct. Whatever there was we had a schedule of.

Q. The iron beams were furnished on contract?—A. Yes.

Q. And the bidder would have nothing to do with them?—A. No, sir.

Q. Then why could he not make as good an estimate here as at St. Paul?—A. That is a question which every member of the committee can answer for himself; I can only say that I, with my experience, would not do it, and I do not believe that any honest contractor would do it; the quality of the work to be done was fixed by the work already done, and nobody could determine that without an examination of it.

Q. Could not a person form a clear idea from a photograph of the building?—A. I could not do it.

By Mr. MUSSEY:

Q. Do you, as an architect, believe it to be possible?—A. I would not do it in any question involving any amount of money.

By Mr. ELA:

Q. Is Mr. Knight still superintendent there?—A. Yes.

Q. What are his duties?—A. He has simply to remain in charge of the building; they are completing the cutting of the granite work.

Q. When was the work suspended?—A. When that proviso was put in the law, except so far as relates to the custody of the building and the superintendence of the granite work; nothing has been done since January, 1870; that is why the Secretary of the Treasury has called attention to the fact that the suspension of work on public buildings is increasing their cost every year.

Q. Who made the estimates in your office of the cost of the building?—A. The computers in the office; an estimate was made of the total cost of the building, and from that the amount already spent was deducted.

By the CHAIRMAN:

Q. Might it not be true that the cost of the work, up to the point it went, exceeded or fell short of the estimate, thus affecting the balance?—A. The difficulty in answering such questions is that, to make the committee understand the matter, I would have to teach the members my profession.

By Mr. ELA:

Q. How many estimates have you had of the cost of the building?—A. I do not know.

Q. How many have you made?—A. I do not know that there have been two estimates made; there was a fraudulent estimate made by Mr. Oetley, which has been already explained to the committee; the other was made by Mr. Rankin.

Q. Has there been any variation of the building from the estimate then made?—A. Not that I know of.

Q. Has there been any variation in the cost of the stone?—A. Not that I know of.

Q. How many contracts have you made for the cutting of the granite?—A. Only one.

Q. Did you not make one with John Stuart & Co.?—A. I believe you have got it on the record. I refer you to the record.

Q. Did you afterward carry on that stone-cutting by days' work?—A. You have got it on the record.

Q. Is it so?—A. You have it on the record. I refer you to the written record.

Q. You say that you got at the amount required to complete the building by taking the original estimates and deducting from them the amount expended?—A. The only thing really valuable about the original estimate to an architect is the quantities. Everything depends upon them; and the computation of them is a work of a great deal of labor.

Q. What was your connection with procuring the Vaux roofing patent?—A. I aided him in explaining the matter before the examiners.

Q. In what way?—A. I went before them personally and explained the matter to them.

Q. What was your interest in the patent after that explanation?—A. I was given a half interest in it.

Q. What was the consideration for that half interest?—A. I do not know what the consideration was. Mr. Vaux said that he would not have got the patent but for my assistance, and he gave the half interest to me voluntarily and of his own free will. I should have done as much for him if I had not got any interest in it.

Q. What did you receive for your interest in the patent when you sold it?—A. I cannot tell; I sold it in detail.

Q. Has that patent ever been used by anybody but the Government?—A. I do not know; I only know that wherever it has been used by the Government it has accomplished the object for which it was designed.

Q. In your contract for roofing with Shepherd & Co., do they furnish the materials?—A. I have no contract with them. The Secretary of the Treasury annulled mine and made one himself. The terms are slightly modified; I cannot state the difference. I am satisfied that the use of this patent is the most advantageous arrangement ever made for the Government. If the roofs of the public buildings had been originally laid in that manner, every dollar since spent on them would have been saved. A copper roof, properly made, is imperishable.

Q. How do you get at the amount of materials used by them on which they are allowed 15 per cent.?—A. Our superintendent receives and takes an account of them—all that is bought on the premises, and all that is taken away.

Q. Is there any report from the superintendent which shows the amount of material left over from any of those jobs?—A. In every case we get a report from the superintendent, or get a certificate that there is nothing left over.

Q. Who makes the orders for the locks used on the Treasury Department, which came from the Johnson Rotary Lock Company?—A. The locks are generally supplied on my order; we get proposals from different parties from time to time. We simply bought of this company because they sold locks cheaper than any one else.

Q. Have contractors under you ever made any subscriptions to the stock of the Morris Mining Company, under such circumstances that you ordered them canceled?—A. Mr. Delafield, of New York, I believe, bought ten shares, and sent me a check for the amount. The stock was not bought through me, nor did I know anything about the circumstances. I took the check to Mr. Hulburd, and asked him to return it, saying that I preferred that no contractor should subscribe for that company's stock. I did not wish it. It was of no particular advantage to me. The board of directors had agreed that we would neither buy nor sell stock, until it became valuable. I have never asked any contractor to subscribe to that stock, nor sent any one to make such a request, and I have no reason to believe that anybody ever said such a thing, except Mr. Thorpe. What he may have said, I do not know. I have not tried even to induce my friends to take that stock. Two or three of them asked me about it, and I told them that if they took it, it was without my advice.

By Mr. GRISWOLD:

Q. What was the amount of that check?—A. Three hundred dollars.

Q. Are you sure that it was not for $1,000?—A. I never saw a check for that company for $1,000.

By the CHAIRMAN:

Q. You had a patent yourself for an improvement in locks, which you sold to the Johnson Rotary Lock Comeany?—A. yes; years ago.

Q. Had you purchased locks of that company before that sale of your patent?—A. I do not know whether I had or not.

Q. Have you since such sale?—A. O, yes; of course I have.

Q. To what extent?—A. That company and the Yale Company are furnishing locks for the post office boxes throughout the country. We used to buy our locks of Robinson, of Boston, but the others are making the same locks at a less price, and just as good. I prefer generally the locks made by the Townsend Company, but they have been asking too high a price.

By Mr. GRISWOLD:

Q. What did you sell your patent to that company for?—A. I sold it for $1,000.

By the CHAIRMAN:

Q. Can you state anything about the annual purchase of locks from that company?—A. No, sir; it is very trifling. The best locks, judging from the samples we have got, are theirs and the Townsend Lock Company's, of New York; but these are very costly. The locks of Russel & Erwin Manufacturing Company are good ones; but they ask prices which the appropriation would not afford me to pay for. The only reason that I have bought from the Johnson Rotary Lock Company is, that they furnish a class of good suitable locks, at less price than we can get such locks for anywhere else.

Q. The locks which you purchase from them do not have the improvement which you patented?—A. O, no; that has nothing to do with the business of the Government. They have got it attached to some of the locks on post office drawers, and to some they have not.

WILLIAM THORPE sworn and examined.

By the CHAIRMAN:

Question. Where do you reside?—Answer. My home is in St. Louis, I reside temporarily in Baltimore.

Q. Do you know Mr. Mullett, Supervising Architect of the Treasury?—A. Yes.

Q. Do you know anything about the Morris Mining Company?—A. I do.

Q. What connection have you had with that company at any time?—A. At one time I was one of the incorporators and one of the trustees; I am now a stockholder only.

Q. To what extent?—A. I believe I own about $158,000 of the stock.

Q. Do you know Richard Dunbar?—A. Yes, sir.

Q. Did you ever call with him on Mr. Mullett?—A. Not that I know of; I believe I met him on one occasion in Mr. Mullett's room.

Q. What conversation, if any, did you have with Mr. Dunbar and Mr. Mullett at that time?—A. At that time Mr. Mullett was treasurer of the company. The company needed funds to carry on its operations at the mines. As I was largely interested in it, I made all the effort I could to raise additional funds. Mr. Dunbar had previously called at the office of the company and we had had some conversation about those mines. He told me about some mineral springs, and I told him about our wanting to raise some funds. He said he had a good many friends in New York, moneyed men, whom he could influence to go into it. I told him that I had no authority to make arrangements with him, but that if he could raise money for the company we would pay him for it. I introduced him to General Dent, who was a trustee of the company at that time. General Dent took a good deal of interest in Dunbar and gave him two letters to friends in New York. I afterwards met Mr. Dunbar in Mr. Mullett's office. I mentioned it to Mr. Mullett and asked him whether he knew Dunbar, and whether he was reliable and whether he would do to work for us. Mr. Mullett said to me, "You can make whatever arrangements with him you please, and it will be all right."

Q. That is, that you could make any arrangements with Dunbar that you pleased?—A. Yes, to sell this stock.

Q. Was there anything else said on that occasion?—A. No, sir; nothing else. I may have seen Mr. Dunbar once or twice afterwards. He told me that he had some business with Mr. Mullett about some building in Minnesota or Wisconsin. He and Senator Carpenter, I think, he told me working at something; but I do not recollect exactly what it was. I then went to the president of the company, Colonel McGruder, and told him that Mr. Dunbar wanted to take some of the stock to New York to sell. Colonel McGruder refused to issue it to him, unless he paid for it. I was fully impressed with the belief that Mr. Dunbar could do something in the matter, and I gave him $5,000 of stock of my own, which he promised to sell for me, I intending to give that money to the company and to take the same amount of stock from the company, provided he sold it.

Q. What did he do with the stock?—A. He returned it after a while; I demanded it of him; I did not care to trust him with it; he returned it all right.

Q. Was there any connection between his taking this stock and endeavoring to sell it, and the bid on this building at the West, so far as you understand?—A. Not that I know anything about. I had nothing to do with the building. I never mentioned anything of the kind.

Q. Had Mr. Mullett ever mentioned this man, Dunbar, to you as a person who would sell stock?—A. No sir; I introduced him to Mr. Mullett and to all the trustees of the company but one or two; I had known him before.

Q. Was anything said in the conversation between yourself and Mr. Dunbar about parties in New York, who were contractors for or connected with the new post office building there, having taken any of the stock?—A. No, sir; not that I recollect.

Q. Do you know anything about whether it was true that any of the stock had been negotiated with any of the parties connected with the New York post office?—A. No, sir. I never negotiated any of the stock, except in two cases here with two gentlemen. One of them was Dr. Antisell, and another was Mr. Poe, of Georgetown. These were the only two men that I ever had anything to do with in connection with the stock of the company.

Q. Did you have anything to do with bringing Mr. Dunbar to Mr. Mullet's office?—A. No, sir. I met him there. I do not think I ever went there with him. I think I met him there two or three times; but only once that I had any conversation with him on the subject of this stock.

Q. Do you know of any instance in which that stock was negotiated or attempted to be negotiated with contractors or persons doing work under the charge of the Supervising Architect of the Treasury?—A. I believe that I spoke to Mr. Mills, who was a clerk in Mr. Mullett's office, and to another young man there, also a clerk. Those were the only parties I spoke to about taking some of the stock.

Q. That was for themselves to take it?—A. Yes.

Q. Have you heard of any instance in which it was attempted to negotiate this stock with contractors upon public works?—A. I have no knowledge of that kind.

Q. Have you any information of the subject?—A. No, sir, except that about a year ago General Crittenden, who was then secretary of the company, went to New York on this business, and he told me that a gentleman employed there, by the name of O'Beirne, was going to take some of the stock.

By Mr. GRISWOLD:

Q. Did you tell Mr. Dunbar or any one else that it was usual for contractors on Government work to take that stock?—A. No, sir.

Q. And that if they took it their contracts would be all right?—A. I never told anybody any such thing; I never knew of such a thing.

Q. What did your stock cost you?—A. I do not remember exactly what it cost me. I went into the purchase of the property; I was to pay a certain amount of money and to take a certain proportion of the stock.

Q. And then you helped to get up the company, and the stock was divided around?—A. Yes.

By Mr. PHELPS:

Q. You spoke about meeting Mr. Dunbar at Mr. Mullett's office; was that meeting accidental?—A. Entirely accidental.

Q. Not by any previous arrangement?—A. No, sir.

JAMES A. MCGRUDER sworn and examined.

By Mr. MUSSEY:

Question. State your connection with the Morris Mining Company.—Answer. Some fifteen months ago they proposed here in Washington to raise a company to be called the Morris Mining Company of Colorado, to prosecute a tunnel which had been already commenced. Dr. Kane, as I understood it, had bought this property, and had made a contract to run a tunnel 300 feet. They had got about 90 feet with the tunnel, and then ran out of funds. They thought they would have a good thing of it, as there were a great many lodes which they thought they would strike in the course of that 300 feet of tunneling. After inquiries from parties whom I knew, and who knew something about the country, and particularly of Dr. Kane, who I understood was a very reliable man, I went into it. They offered to make the stock $600,000; to give the trustees, or directors, $10,000 each, a hundred shares; and they retained so much, and then put a thousand shares, or $100,000 worth of stock, in the hands of the company as a working capital, to go on and prosecute the work. They had paid for the tunnel as far as it had gone, 90 feet. The company was formed upon that basis. We went to work, and agreed to sell the stock at 30 or 35 cents on the dollar, just as fast as we could get the money to carry out the contract made with Mr. Morris for the running of the tunnel. Dr. Antisell was one of the directors. He bought some five or six hundred dollars' worth of stock in his wife's name, and Poe invested some five or six hundred dollars. Mr. West, of the Treasury Department, went to Mr. Mullett and said that he had some money and that he was going to put it in the Morris stock. Mr. Mullett told him not to do it. He said, "If you have got any money which you can afford to lose, I believe it is a good thing, but it is nothing but a speculation;" and he advised Mr. West not to take it, and he did not take it. Crittenden went to New York and sold about $1,000 worth of stock to different parties. Among others he sold ten shares to Mr. Delafield, at 35 cents on the dollar, making $350. For a certain reason the checks were made payable to Mr. Mullett's order, as treasurer of the company. I happened to meet Mr. Mullett in New York, accidentally. He came to me in a good deal of excitement, and said to me, "Colonel, here are a lot of checks which Crittenden gave to me, and which are payable to my order. I am not going to use these checks, because the next thing would be that I would be accused of making use of my position to sell this stock." I said, "Give me the checks, and do you just keep quiet." After talking to him for about ten minutes I got the checks and told him that I would make it all right. I went to Mr. Delafield, the only man connected with the Government who had bought any of the stock, and I stated the circumstances to him. I said, "Mr. Delafield, Mr. Mullett does not want you to take this stock as a favor to him. I believe that it is good stock, and if you can afford to lose $350 I would advise you to take it; but if $350 is a matter of bread and butter to you I advise you not to take it." He said that he would take it. He tore up the check and drew another check in my favor. Mr. Delafield understood the whole thing.

Q. You say that nobody else in New York who had any connection with the Government took any stock in that company?—A. No one else, that I know of. And as an evidence of it there has not been $5,000 of the $100,000 of stock sold. We have been carrying on the work, by borrowing money on our own individual responsibility, until we have got the tunnel in 300 feet. It is represented as first-rate property, and we

have been trying to retain it. The contractor sued us last September. We could not raise the money to pay him, and he prosecuted his suit to a judgment, which was only paid the other day by the individual trustees here giving their individual notes and raising money to pay it. We have paid for 214 feet of tunnel, at $25 a foot, and there was about $1,000 spent on a lode which was struck. That is about all the money spent by the company.

Q. About what time was this sale made by Crittenden to Delafield, in New York?—A. I think it was last spring. I happened to know this much about the Dunbar matter: Mr. Thorpe came to me and wanted me to issue stock of the company for Mr. Dunbar to sell. I said I would do no such thing; that I did not know anything about Mr. Dunbar, and that I was not going to throw the stock of the company into the hands of Tom, Dick, and Harry. He went off and came back afterwards and said, "I want you to sign some certificates of stock of mine. I know Mr. Dunbar. I will give him my stock, and when he sells it I will then take the same proportion of stock from the company, and turn the money into the treasury of the company." But we have never seen any of it. Mr. Mullett told me at the time that Mr. Thorpe had made the same proposition to him, and that he had refused to do it. I have heard Mr. Thorpe's statement here. It is about as correct as anything can be.

By Mr. MUSSEY:

Q. You confirm it entirely, so far as your knowledge goes?—A. There is no doubt about it. I think that is the whole state of the case. We thought we had a good thing of it, and we think so yet.

By the CHAIRMAN:

Q. State whether any stock of either of those companies has ever been sold or negotiated to any person connected with contracts for buildings for the Government?—A. I think not. With the exception of Delafield, I do not know of anybody else.

Interrogatories proposed to be submitted to Mr. A. H. Wilder, on behalf of Mr. Mullett.

1. Were you one of the bidders for the completion of the St. Paul custom-house? If so, what was your bid and upon what was it based; personal inspection of the work, or estimates, and if so, whose, or both?

2. Do you know Richard Dunbar? If so, when did you first become acquainted with him?

3. If you answer that you know Richard Dunbar, please state whether you ever had any conversation with him relative to the bids for the completion of the custom-house at St. Paul, and if you had any conversation or conversations, please state them or it fully and at large?

4. Was your bid, if you made one for the completion of the St. Paul custom-house, accepted or refused? State any conversation you had with Mr. Mullett concerning your bid and others' bids, if you had any conversation with him on the subject?

R. D. MUSSEY,
for Mr. Mullett.

Answers of Amherst H. Wilder, of St. Paul, Minnesota, to the annexed interrogatories propounded to him on behalf of A. B. Mullett, in the matter of the investigation pending before the Committee on Expenditures on the Public Buildings of the House of Representatives of the United States, at Washington, D. C., said answers being taken and reduced to writing by Harvey Officer, a notary public in and for the county of Ramsey, and the said Amherst H, Wilder having been first duly sworn to make true answers to the said annexed interrogatories.

In answer to the first interrogatory he saith: I was one of the bidders for the completion of the St. Paul custom-house. My bid was one hundred and thirty-six thousand seven hundred and seventy-six dollars and thirty-four cents, ($136,776 34.) My bid was based upon personal inspection of the work, upon estimates made by parties in St. Paul, and more particularly upon estimates made for me by J. K. Place, of St. Paul.

In answer to the second interrogatory he saith: I do know Richard Dunbar. I first met him at the National Hotel, at Washington, D. C., about the 15th or 20th of June, 1870, he having then called upon me at that hotel, where I was then stopping.

In answer to the third interrogatory he saith: At the time he first called upon me at the National Hotel, at Washington, about the time above stated, I did have a conversation with him relative to the bids for the completion of the St. Paul custom-house. We discussed the various bids (there having been six bids in all) made for the completion of the St. Paul custom-house, and the prospect of getting such legislation as would enable the Secretary of the Treasury to act upon the bids referred to and then under discussion between us. Dunbar thought this could be done, as he had influen-

tial friends in Congress who would interest themselves in his behalf. He said if the contract could be had at my bid it would pay well. I replied, I thought the price named in his own bid, and in that of Grindall, was much less than it would cost to complete the building, and that I did not suppose his (Dunbar's) bid was put in to be taken up, but to be in the way of the bids of other parties. Dunbar said he had bid, expecting to do the work if the contract should be awarded to him, and that there was some money in it, he thought, at the figures of his bid; however, that he would withdraw his bid for a reasonable sum, and let it run up to the bids of the St. Paul parties. I told Mr. Dunbar that while I should be very glad to have the contract for the completion of the building, I was more anxious that a contract should be awarded to some one for the immediate completion of the building, for the reason that until that time I could not get my pay for the granite-cutting, or for the granite furnished, and which then amounted to about $40,000. This is the substance of our conversation on the subject at this first meeting; and at parting with him on that occasion we both agreed to see our friends in Congress, and request them to get such legislation as would enable the Secretary of the Treasury to make a contract for the completion of the building. I do not think I ever met Mr. Dunbar to have any conversation with him on this subject, after date of the interview above mentioned, until after the appropriation bill in which $100,000 was appropriated for the St. Paul custom-house had passed the House, and which bill was approved July 15, 1870. The next day—I think it was—after the passage of this appropriation bill in the House, Dunbar called upon me at the hotel and insisted that it would be to my interest to get his bid out of the way, as he was satisfied I could get the contract for completing the building if I did so. I replied that no contracts could be awarded upon any of the bids made, as the restriction in the bill appropriating $100,000 for the building necessarily prevented the award of a contract on any of the bids made. Dunbar then said that he knew I would get the contract in the end if he was out of the way, and that he would withdraw his bid for $5,000. I declined to accept his proposition. I told him he would not be allowed to withdraw his bid; that I had asked Mr. Mullett if a bidder would be allowed to withdraw his bid, and that he (Mullett) told me it could not be done; and that if authority was given to make a contract for the completion of the St. Paul custom-house, that contract would be offered to Mr. Dunbar; and that if he refused to accept it in accordance with his bid, he would prosecute his bondsmen. This was the last conversation I had with Dunbar, and the last time I saw him.

In answer to the fourth interrogatory he saith: My bid for the completion of the St. Paul custom-house was refused. I received written notice of its refusal from A. F. Knight, superintendent United States custom-house at St. Paul. I asked Mr. Mullett if he thought Mr. Dunbar could complete the St. Paul custom-house for the price named in his bid. He replied that in his opinion he could not. I then asked him (Mullett) if he would allow Dunbar to withdraw his bid. His reply was, that he would not; that Dunbar's bond was a good one, and he would force him to carry out the contract according to his proposition, if authority was granted to make a contract. I told Mullett I should like the contract. He replied, he should be glad to see me have it, but that as I was not the lowest bidder there was no way for me to get it. I then abandoned all idea of getting my bid considered. This conversation with Mullett was soon after my first conversation with Dunbar, and before my second interview with him, and was the only conversation that I ever had with Mullett (that I recollect of) relative to withdrawing bids, or considering mine. I do not pretend to give the exact language used by Mr. Mullett in the conversation, but the above is the substance of all conversations with him in relation to this matter, and the same remark applies to my conversations with Mr. Dunbar.

A. H. WILDER.

Subscribed and sworn to before me this 22d day of February, A. D. 1871.
[SEAL.]

HARVEY OFFICER,
Notary Public, Ramsey County, Minnesota.

41ST CONGRESS, 3rd Session. } HOUSE OF REPRESENTATIVES. { REPORT No. 52.

REMOVAL OF THE NATIONAL CAPITAL.

MARCH 3, 1871.—Ordered to be printed.

Mr. COBURN, from the minority of the Committee on Public Expenditures, submitted the following

AS THE

VIEWS OF THE MINORITY

The Committee on Public Expenditures, to whom were referred the resolution of Mr. Crebs, of Illinois, in relation to the removal of the national capital to the Mississippi Valley, and the memorials of a large number of citizens of different parts of the United States pertaining to the same subject, having resolved to recommend that the same be reported back with the recommendation that they be laid on the table, the minority of the committee, dissenting from their views, beg leave to submit the following report:

In order to look fully into the whole subject it will be necessary to repeat briefly the history of the location and continuance of the Capital in its present situation, and to refer to those constitutional provisions and legislative enactments which relate to it. At the time of the adoption of the Constitution no place had been selected, and a provision looking to a seat of Government was inserted in the Constitution, which may be properly quoted, and, being the seventeenth of the enumerated powers of Congress, is in the following words:

> The Congress shall have power * * * to exercise exclusive legislation in all cases whatsoever over such district (not exceeding ten miles square) as may, by cession of particular States and the acceptance of Congress, become the seat of Government of the United States, and to exercise like authority over all places purchased by the consent of the legislature of the State in which the same shall be, for the erection of forts, magazines, arsenals, dock-yards, and other needful buildings.

It may be well to note, in passing, that this power as to the District for the seat of Government is classed with that over forts, dock-yards, arsenals, and other needful buildings. There seems to be no power to fix permanently the capital at any point, but, like a dock-yard or arsenal, it is to be located where it is needed, to remain there while necessity may require it, and no longer. There is nothing else in the Constitution looking to the founding and building of a national capital. The point definitely determined was the power to exercise exclusive legislation.

The only mention in the Constitution of the seat of Government thus being incidental, and occurring in the enumeration of the places where Congress has exclusive power of legislation, we are left to infer that it is equally applicable to the seat of Government wherever situated, whether on the Potomac, the Ohio, the Mississippi, or the great Plains. This exclusive power is the single, permanent, unalterable thing; the location is nothing—is not mentioned. It were as sensible to say that a dock-yard or an arsenal shall be a dock-yard or an arsenal forever because they have once been located and jurisdiction ceded, and that

they shall be perpetually kept for those uses, though the very channels of the sea should be obstructed and every element of use or defense be annihilated.

But, as if to put this matter forever at rest in relation to this very subject, in the 43d number of the Federalist, written by Mr. Madison, we find the argument used in favor of giving Congress the exclusive power of legislation over the District that it thereby should have the untrammeled power of removal. We quote the passage as follows:

> The indispensable necessity of complete authority at the seat of Government carries its own evidence with it. It is a power exercised by every legislature of the Union—I might say of the world—by virtue of its general supremacy. Without it not only the public authority might be insulted and its proceedings be interrupted with impunity, but a dependence of the members of the General Government on the State comprehending the seat of the Government for protection in the exercise of their duty might bring on the national councils an imputation of awe or influence equally dishonorable to the Government and dissatisfactory to the other members of the Confederacy. This consideration has the more weight as the gradual accumulation of public improvements at the stationary residence of the Government would be both too great a public pledge to be left in the hands of a single State, and would create so many obstacles to a removal of the Government as still further to abridge its necessary independence.

Here, then, we find one of the fathers of the Constitution expressly stating that the only provision in it concerning a national capital was framed with a view to its removal, and in the most emphatic manner calling attention to it as containing one of the powers necessary to the maintenance of a free and independent government. We may then say with some assurance that it was not intended at the foundation to make the capital immovable, the Constitution being framed expressly to exclude such an idea and the acts of cession containing no conditions to that effect. Had it been intended otherwise, both the Constitution and the acts of cession and acceptance would have contained such positive provisions.

In a debate upon this clause of the Constitution Mr. Madison, among other things, said:

> Was there ever a legislature in existence that held their sessions at a place where they had not jurisdiction? * * * * * * * * * When the honorable member objects to giving the General Government jurisdiction over the place of their session, does he mean that it should be under the control of any particular State, that might at a critical moment seize it? I should have thought that this clause would have met with the most cordial approbation. As the consent of the State in which it may be must be obtained, and as it may stipulate the terms of the grant, should they violate the particular stipulations it would be an usurpation.

The whole matter in controversy was as to the exclusive control of the place; not that it should be fixed permanently in one place. No terms making the place permanent were affixed to the act of cession; nothing of the kind was thought of. On the contrary, in another speech in 1790 he says that the law fixing the capital at Washington may be repealed, as follows: "It is said that before the ten years expire a repeal of the act may take place, and thus Congress be kept at Philadelphia. But what more can we do than pass a law for this purpose? It is not in our power to guard against a repeal. Our acts are not like those of the Medes and Persians, unalterable. A repeal is a thing against which no provision can be made. If this is an objection it holds good against any law that can be passed."

Before the final location of the capital at Washington the sessions of Congress were held at different places, such as Philadelphia, New York, Princeton, and Annapolis. It was deemed best to have some resting place for the Government, where the officers should reside permanently

and the sessions of Congress be regularly held. Several acts of Congress were passed, which follow in the order of their date.

The following act locating the seat of Government at its present place was passed by the First Congress, July 16, 1790, while in session at New York:

AN ACT for establishing the temporary and permanent seat of the Government of the United States.—
[First Congress, sess. ii, ch. 28, U. S. Statutes at Large.]

SECTION 1. *Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled*, That a district of territory, not exceeding ten miles square, to be located as hereafter directed, on the river Potomac, at some place between the mouths of the Eastern Branch and Connogochague, be, and the same is hereby, accepted for the permanent seat of the Government of the United States: *Provided, nevertheless*, That the operation of the laws of the State within such district shall not be affected by this acceptance until the time fixed for the removal of the Government thereto, and until Congress shall otherwise by law provide.

SEC. 2. *And be it further enacted*, That the President of the United States be authorized to appoint, and, by supplying vacancies happening from refusals to act or other causes, to keep in appointment as long as may be necessary, three commissioners, who, or any two of them, shall, under direction of the President, survey, and, by proper metes and bounds, define and limit a district of territory under the limitations above mentioned; and the district so defined, limited, and located shall be deemed the district accepted by this act for the permanent seat of the Government of the United States.

SEC. 3. *And be it further enacted*, That the said commissioners, or any two of them, shall have power to purchase or accept such quantity of land on the eastern side of the said river, within the said district, as the President shall deem proper for the use of the United States; and, according to such plans as the President shall approve, the said commissioners, or any two of them, shall, prior to the first Monday in December, in the year one thousand eight hundred, provide suitable buildings for the accommodation of Congress and of the President, and for the public offices of the Government of the United States.

SEC. 4. *And be it further enacted*, That for defraying the expense of such purchases and buildings the President of the United States shall be authorized and requested to accept grants of money.

SEC. 5. *And be it further enacted*, That prior to the first Monday in December next all offices attached to the seat of Government of the United States shall be removed to, and until the said first Monday in December, in the year one thousand eight hundred, shall remain at the city of Philadelphia, in the State of Pennsylvania, at which place the session of Congress next ensuing the present shall be held.

SEC. 6. *And be it further enacted*, That on the said first Monday in December, in the year one thousand eight hundred, the seat of the Government of the United States shall, by virtue of this act, be transferred to the district and place aforesaid, and all offices attached to the said seat of Government shall accordingly be removed thereto by their respective holders, and shall, after the said day, cease to be exercised elsewhere; and that the necessary expense of such removal shall be defrayed out of the duties on imports and tonnage, of which a sufficient sum is hereby appropriated.

Approved July 16, 1790.

The following amendatory act was also passed by the First Congress, March 3, 1791, after the temporary removal of the seat of Government to Philadelphia:

AN ACT to amend an act for establishing the temporary and permanent seat of the Government of the United States.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That so much of the act entitled "An act for establishing the temporary and permanent seat of the Government of the United States," as requires that the whole of the district of territory, not exceeding ten miles square, to be located on the river Potomac for the permanent seat of the Government of the United States, shall be located above the mouth of the Eastern Branch, be, and is hereby, repealed, and that it shall be lawful for the President to make any part of the territory below the said limit and above the mouth of Hunting Creek a part of the said district, so as to include a convenient part of the Eastern Branch and of the lands lying on the lower side thereof, and also the town of Alexandria; and the territory so to be included shall form a part of the district, not exceeding ten miles square, for the permanent seat of Government of the United States, in like manner and to all intents and purposes as if the same had been within the purview of the above recited act: *Provided*, That nothing

herein contained shall authorize the erection of the public buildings otherwise than on the Maryland side of the river Potomac, as required by the aforesaid act.

Approved March 3, 1791.

The following act, passed May 6, 1796, by the Fourth Congress, while sitting at Philadelphia, provides for the public expense necessary to the permanent establishment of the seat of Government at Washington City, to which place it was removed in 1800:

AN ACT authorizing a loan for the use of the city of Washington, in the District of Columbia, and for other purposes herein mentioned.

SECTION 1. *Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the commissioners under the act entitled "An act for establishing the temporary and permanent seat of the Government of the United States," be, and they are hereby, authorized, under the direction of the President of the United States, to borrow, from time to time, such sum or sums of money as the said President shall direct, not exceeding three hundred thousand dollars in the whole, and not exceeding two hundred thousand dollars in any one year, at an interest not exceeding six per centum per annum, and reimbursable at any time after the year one thousand eight hundred and three, by installments not exceeding one-fifth of the whole sum borrowed in any one year; which said loan or loans shall be appropriated and applied by the said commissioners, in carrying into effect the above-recited act, under the control of the President of the United States.

SEC. 2. *And be it further enacted,* That all the lots, except those now appropriated to public use in the said city, vested in the commissioners aforesaid, or in trustees, in any manner, for the use of the United States, now holden and remaining unsold, shall be and are hereby declared and made chargeable with the repayment of all and every sum and sums of money, and interest thereupon, which shall be borrowed in pursuance of this act; and to the end that the same may be fully and punctually repaid, the said lots, or so many of them as shall be necessary, shall be sold and conveyed at such times, and in such manner, and on such terms, as the President of the United States for the time being shall direct; and the moneys arising from the said sales shall be applied and appropriated, under his direction, to the discharge of the said loans, after first paying the original proprietors any balances due to them respectively, according to their several conveyance to the said commissioners or trustees. And if the product of the sales of all the said lots shall prove inadequate to the payment of the principal and interest of the sum borrowed under this act, then the deficiencies shall be paid by the United States, agreeably to the terms of the said loans; for it is expressly hereby declared and provided that the United States shall be liable only for the repayment of the balance of the moneys to be borrowed under this act, which shall remain unsatisfied by the sales of all the lots aforesaid, if any such balance shall thereafter happen.

SEC. 3. *And be it further enacted,* That every purchaser or purchasers, his or their heirs or assigns, from the said commissioners or trustees, under the direction of the said President, of any of the lots hereinbefore mentioned, after paying the price and fulfilling the terms stipulated and agreed to be paid and fulfilled, shall have, hold, and enjoy the said lot or lots so bought, free, clear, and exonerated from the charge and incumbrance hereby laid upon the same.

SEC. 4. *And be it further enacted,* That the commissioners aforesaid shall semi-annually render to the Secretary of the Treasury a particular account of the receipts and expenditures of all moneys intrusted to them, and also the progress and state of the business, and of the funds under their administration; and that the said Secretary lay the same before Congress at every session after the receipt thereof.

Approved May 6, 1796.

We deem it proper next to refer to the acts of cession of Maryland and Virginia in relation to the District of Columbia. These acts are quoted to show the precise terms upon which the cession was made.

The following are the acts of cession of Maryland:

Act of November, 1788.

AN ACT to cede to Congress a district of ten miles square in this State for the seat of the Government of the United States.

Be it enacted by the general assembly of Maryland, That the Representatives of this State in the House of Representatives of the Congress of the United States, appointed to assemble at New York on the first Wednesday of March next, be, and they are hereby, authorized and required, on the behalf of this State, to cede to the Congress of the United States any district in this State not exceeding ten miles square, which the Congress may fix upon and accept for the seat of Government of the United States.

AN ACT concerning the territory of Columbia and the city of Washington.—[Lib. J. G. No. 1, fol. 431; Supplements number 1792, ch. 59, 1793, ch. 58.]

2. *Be it enacted by the general assembly of Maryland*, That all that part of the said territory called Columbia, which lies within the limits of this State, shall be and the same is hereby acknowledged to be forever ceded and relinquished to the Congress and Government of the United States, in full and absolute right, and exclusive jurisdiction, as well of soil as of persons residing, or to reside, thereon, pursuant to the tenor and effect of eighth section of the first article of the Constitution of Government of the United States: *Provided*, That nothing herein contained shall be so construed to vest in the United States any right of property in the soil, or to affect the rights of individuals therein, otherwise than the same shall or may be transferred by such individuals to the United States: *And provided also*, That the jurisdiction of the laws of this State over the persons and property of individuals residing within the limits of the cession aforesaid shall not cease or determine until Congress shall by law provide for the Government thereof, under their jurisdiction in manner provided by the article of the Constitution before recited.

In passing we remark that in another section of this act of cession there is to be found the condition that liquors shall not be sold in the District in a less quantity than ten gallons at one time, thus securing temperance forever in the District; but one that seems not to be binding and effectual.

The following is the act of cession of Virginia:

AN ACT for the cession of ten miles square, or any lesser quantity of territory within this State, to the United States in Congress assembled, for the permanent seat of the General Government. [Passed the 3d of December, 1789.]

SECTION 1. Whereas the equal and common benefits resulting from the administration of the General Government will be best diffused, and its operations become more prompt and certain, by establishing such a situation for the seat of the said Government as will be most central and convenient to the citizens of the United States at large, having regard as well to population, extent of territory, and a free navigation to the Atlantic Ocean, through the Chesapeake Bay, as to the most direct and ready communication with our fellow-citizens in the Western frontier; and whereas it appears to this assembly that a situation combining all the considerations and advantages before recited may be had on the banks of the river Potomac, above tide-water, in a country rich and fertile in soil, healthy and salubrious in climate, and abounding in all the necessaries and conveniences of life, where, in a location of ten miles square, if the wisdom of Congress shall so direct, the States of Pennsylvania, Maryland, and Virginia may participate in such location:

Be it therefore enacted by the general assembly, That a tract of country, not exceeding ten miles square, or any lesser quantity, to be located within the limits of this State, and in any part thereof as Congress may by law direct, shall be, and the same is hereby forever ceded and relinquished to the Congress and Government of the United States, in full and absolute right, and exclusive jurisdiction as well of soil as of persons residing or to reside thereon, pursuant to the tenor and effect of the eighth section of the first article of the Constitution of Government of the United States.

SEC. 2. *Provided*, That nothing herein contained shall be construed to vest in the United States any right of property in the soil, or to affect the rights of individuals therein, otherwise than the same shall or may be transferred by such individuals to the United States.

SEC. 3. *And provided also*, That the jurisdiction of the laws of this Commonwealth, over the persons and property of individuals residing within the limits of the cession aforesaid, shall not cease or determine until Congress, having accepted the said cession, shall by law provide for the government thereof, under their jurisdiction, in manner provided by the article of the Constitution before recited.

It will be seen by this that in 1789 the general assembly of Virginia, in the solemn act of cession, declared that "the equal and common benefits resulting from the administration of the General Government will be best diffused, and its operations become more prompt and certain, by establishing such a situation for the seat of the said Government as will be most central and convenient to the citizens of the United States at large, having regard as well to population, extent of territory, and a free navigation of the Atlantic Ocean, through the Chesapeake Bay, as to the most direct and ready communication with our fellow-citizens in the western frontier"; and that "such a situation can be had on the

banks of the Potomac." Here then we see set out the very quality and essence of the proper situation of the national capital. It seems that they understood the matter then quite well in Virginia, and that it has been reserved for modern times to disregard these conditions and to hold that a central position is worthless. But there is still another point in this act of cession worthy of note, and that is that the capital was to be located "above tide-water, in a country rich and fertile in soil, healthy and salubrious in climate, and abounding in all the necessaries and conveniences of life, where, in a location of ten miles square, if the wisdom of Congress shall so direct, the States of Pennsylvania, Maryland, and Virginia may participate in such location." And it was supposed then that somewhere in Northern Virginia, and Maryland, and Southern Pennsylvania was that healthy, fertile, and delightful spot which was ceded, or was to be ceded at some future time, for the capital of the nation. This was not where we find it now.

It is thus apparent that by the act of Congress of July, 1790, the District, of ten miles square, was accepted, and was to be located between the mouth of the Eastern Branch, which is in the southern part of the present City of Washington, and the mouth of the Connogocheague, a tributary of the Potomac some fifty miles above. This law was amended in March, 1791, and the southern limit of the District fixed at any point above the mouth of Hunting Creek, so as to include the Eastern Branch and Alexandria. This law was amended in July, 1846, by an act of retrocession to Virginia of that portion of the District west of the Potomac. The acceptance was made in 1790, was changed in 1791, and was in part relinquished in 1846. The location, the acceptance, the retrocession were all mere ordinary acts of legislation; the latter two were based upon and in amendment of the first. No question was raised as to the power to alter or change the act of 1790 then. The power of Congress was not considered exhausted by its exercise in 1790, by the acceptance of the cession. If so, its location could not have been altered, and almost half could not have been retroceded. Mr. Madison, before the act of 1790 passed, declared in Congress that the location of the capital might be changed by act of Congress; that such an act was but an ordinary act of legislation.

In pursuance of these acts of location, the District was surveyed in 1793, and the seat of Government removed to it in 1800. And Congress exercised exclusive jurisdiction over the whole District until 1846, when that part ceded by Virginia was given back, and since then it has been under the control of the authorities of Virginia, or treated as a part of Virginia, and not of the District, by all parties, State and National. There the act of cession and the acceptance have been set aside and are in force no more. If this can be done on the Virginia side of the Potomac, why not on the Maryland side? Why not with as much propriety retrocede to Maryland as to Virginia?

Turning from the history of the matter and the law in relation thereto, it may be well to look to the state of the country then and since as a part of the subject. When the seat of Government was fixed on the Potomac the population of the United States was about four millions, dwelling in the States bordering or contiguous to those on the Atlantic coast; the region beyond the Alleghany Mountains and the Ohio River was a wilderness, and Louisiana and all the territory west of the Mississippi River belonged to France. Our whole national area was but a little more than six hundred thousand square miles. The center of population, trade, business, wealth, and political power was not far from the District of Columbia, and the location was made expressly with

reference to that fact, as the debates in Congress at that time and the acts of cession show, and was the result of a controversy and compromise among conflicting interests. A point upon the Susquehanna and Germantown, both in Pennsylvania, not many miles distant from the center of the country, as then constituted, were the rival positions to the present location at Washington.

Since then the progress of the people, the influx of immigrants, the growth of business, the construction of the great routes and means of travel by steam, and the annexation and purchase of territory have left the seat of Government upon the verge of the country, and converted it from a central to a border city. Every argument used for its location where it is may now be used against it. It is not central, it is not convenient of access to the majority of the people, it harmonizes no conflict by its present location.

Our population is almost tenfold greater than at that time; our wealth has increased in greater proportion, and our area from six hundred and ten thousand has grown to three millions five hundred and thirty thousand square miles. We find our nation stretched across the continent, with the tide of growth and people moving westward; the valley of the Mississippi and the great lakes, with the largest portion of productive soil and salubrious climate in the midst; capable of sustaining a vast population of farmers, planters, gardeners, mechanics, miners, traders, and men of every occupation known to civilized man; the widest, richest, and grandest valley on the globe, and now well occupied by a vigorous, brave, and patriotic people, whose material interests, if nothing else, must forever make them national in spirit, who must forever, while they maintain a just independence, have a right to own and keep open and free the outlets to either frontier, east, west, north, and south; a people that must of necessity be jealous of dismemberment and disunion, and that cannot see the day when it will be profitable to them to advocate secession or consent to it.

To show what a firm basis there is for the future growth and perpetual wealth and power of the Mississippi Valley, we need but look at its vast breadth in comparison with other sections of the Union of good fertile plow and pasture land, unbroken by hills or unproductive sections, and to the great coal fields of Ohio, Indiana, Kentucky, Illinois, Missouri, and Iowa. The State of Illinois alone is estimated by Professor Rodgers to contain 1,227,000,000,000 tons of coal, while Pennsylvania contains 316,400,000,000 tons, and Great Britain but 190,000,000,000 tons of coal. These great States have a hundred times the capacity for manufacturing that England has, with a soil upon which the staple articles of food and clothing are grown in excess. In 1860 the census reports show that the comparatively new States of Illinois, Missouri, Iowa, Wisconsin, and Minnesota contained 27,582,030 acres of improved land, being about one-sixth of the whole in the United States, which was estimated at 163,261,389 acres. These States, as appears by the agricultural report, produced in 1864 crops in value $403,692,574. The whole value of the crops of the United States was $1,564,543,690. The whole value of live stock January 1, 1865, was $990,876,128. These States produced $273,363,730, in each case more than one-fourth. These States produced a little less than half of the wheat and corn crops of that year, and more than one-third of the cattle and hogs, at that time having about one-seventh part of the population. The surplus we have to export hereafter in agricultural as well as mechanical products must come largely from the valley of the Mississippi. The great chain of iron works must extend on the margin of the Ohio River, from Pittsburg to Cairo. The

Cumberland has its works also; so has the Mississippi, and both are rapidly developing and increasing. The central regions of Ohio and Indiana, with coal of the finest quality, are now extensively engaged in iron manufactures. Missouri has its inestimable mountains of iron; Michigan rivals Missouri in this respect, and Wisconsin, in its north-eastern sections, has developed recently similar deposits. The future of these great central river and lake States of the West baffles and defies calculation.

But in this estimate we have looked at but a small portion of the population and territory which must be accommodated by a removal of the capital to the valley of the Mississippi. The great States of Tennessee, Alabama, Mississippi, Louisiana, Arkansas, and Texas, have in them surpassing elements of wealth and progress. Their railroad and river systems of transportation and travel all bind them to the regions of the Ohio, the Wabash, the Missouri, and the lakes, and constitute them a part of that central portion of the republic as well as of the continent which must become more powerful as time progresses. And the enormous surplus in cotton, cattle, corn, tobacco, sugar, horses and mules of this great southwestern region will rival that of its immediate northern neighbor in other staples of commerce. The report of the Commissioner of the Census, accompanying, shows the population of the Central, Gulf, and Western States to exceed by millions that of the Eastern and Atlantic States. The men who control this vast wealth, power, and population, present and prospective, will never be satisfied with a capital upon the borders, upon the seaboard, at one side of the real and permanent heart of the nation, and they will move it to the place where it belongs. This, in our judgment, is as inevitable as the growth of the country. And it would be as wise to struggle against it as to strive to keep back the tides of population and production which are sweeping with irresistible power into that region. It would be as reasonable as to mourn that there will be within half a century from this time, at the present rate of progress, at least a hundred millions of prosperous citizens in this country; or that the power of this people, should it fortunately remain united, will be the solitary great, overshadowing, colossal, national force of earth. The removal of the capital, in our opinion, is inseparable from the future greatness of our people, and is no more to be deprecated than its vast increase in numbers, wealth, power, and intelligence.

Is it, then, the part of wisdom to go on with the erection of expensive and durable structures in the present place? Would it not be better to wait until the true sense of the nation can be taken upon the question? Would it not be better to use those erected temporarily until the development of the country points out where the capital must go? On the contrary, would it not seem to be in the highest degree wasteful and extravagant to appropriate large sums for buildings at a point which must be abandoned at no distant day?

These facts clearly point to a change of the location of the capital for the convenience of the people, for its safety, and for the permanent existence of the Government itself.

The idea of a capital is, in a great measure, inconsistent with its present location. It should be a place not only for the enacting and administration of the laws, a safe depository of the public records and archives, a residence of the power of the people, but a place easy of access, in as favorable a climate as possible, in as healthy a location as possible, in as convenient a place as possible; easy of defense against foreign enemies, and surrounded by a faithful, courageous, intelligent,

and loyal people whose sympathies and interests are national; central in location, commanding in position. It is not in such a place now. Located where it is the people must forever be more or less sectional; no people can rise entirely above their surroundings. It is difficult of access, distant from the majority, with a variable climate, without great advantages as to health, liable to attack by a foreign foe, indefensible except by a large force at great expense, recently surrounded by the hosts of armed treason, in the midst of a barren region incapable of sustaining a powerful and vigorous people, the capital of the nation sits solitary, helpless, idle, in danger, friendless, and a beggar on the banks of the Potomac.

And while this is said in all candor, it cannot be denied that the mere situation of Washington on the Potomac, with the surrounding hills, is a fine one, and capable of very great and advantageous improvement; and that the Capitol, and a few of the public buildings, are splendid specimens of architecture, which no true American can behold without pride and the highest gratification.

Is there a better place for the capital? This is a subject which the minority deem worthy of inquiry by the Representatives of a great people. It is believed there are many. The banks of the Ohio, the Mississippi, and the Missouri, the great regions covered by farm, forest, or prairie in that safe, central, healthy, and productive valley, furnish very many locations superior to the present one.

And we believe that now is the time to make the inquiry, before further outlays of public money at Washington, for buildings which will ultimately be needed for the public business. There has been already expended upon the buildings and grounds used by the officers of the Government in the transactions of its business as such about the sum of $25,000,000. The other expenditures have been for the city and District, and for such general purposes as are not peculiarly a part of the capital of the nation, such as the Navy Yard, Arsenal, Insane Hospital, Soldiers' Home, Smithsonian Institute, Observatory, bridges, streets, canals, &c. A statement of all these expenditures is appended hereto and made a part of this report. The Capitol has cost, it will be seen, about the sum of $12,000,000; the Treasury about $6,000,000; the Department of Interior building about $4,000,000; the General Post Office about $2,000,000; the Agricultural Department building about $200,000; the President's House about $300,000. These are the only permanent buildings now in use. The exact cost can be seen in the reports appended from the Treasury Department. The buildings occupied by the War and Navy Departments are old and temporary; the State Department is in a rented building, as also the offices of the Coast Survey, the Department of Education, the Census Bureau, as well as several branches of other Departments. Besides the sums expended in the erection of the permanent buildings, the entire balance has been poured out upon the streets, avenues, bridges, squares, and other places in the District. The really permanent structures are the Capitol, the Treasury building, the General Post Office, the Patent Office, and the Agricultural building; but five in all. And these are incomplete or insufficient. The Capitol, while complete in the wings, lacks a central extension to the front on the entire length of that portion, which will cost, by the estimate of the architect, at least $2,000,000. There is not sufficient room now for the libraries, courts, and committees. The Treasury building does not accommodate all its clerks, the largest bureau being in Winder's block, a distant, uncomfortable, and inconvenient building, bought from a private party. The Treasury building itself is incomplete; by the plan it should extend into Fifteenth street, the long colonnade on the eastern

side is to be torn away, and a granite front, corresponding to the western one, is to be erected. The street thus occupied must be removed eastward. Large private buildings will have to be removed also at great expense to the Government. The General Post Office is now crowded and must soon be enlarged, and the Department of the Interior is occupying a large range of buildings not fire-proof, with its clerks, at high rent. But, in addition to these demands, we find that a measure is being pressed upon Congress and a partial appropriation made for the erection for a State, War, and Navy Department buildings to correspond with that of the Treasury, which at present prices must cost about eight millions of dollars. The business of the people with the Government is increasing rapidly, and every one of the great buildings, were they even complete, would be insufficient in a few years. We can point to but a few structures worthy of the name, as many more will soon be needed.

And the existence of these buildings, with the outlay for their construction, are urged as reasons for the retention of the capital here by many who do not know what vast and costly structures must yet be made if the capital remains in Washington.

The accompanying statements of the heads of Departments, and of the Architects of the Capitol and Treasury, show the number of buildings now leased for the use of the Government in Washington City and the amount of rent paid for them. They also show the early demand for large, permanent, and very expensive structures. It will be seen that the War Department pays rent amounting to $55,180 a year; the Department of State, $18,750; the Navy Department, $3,020; the Depart- of the Interior pays $21,080; the Treasury Department, $4,500; and the Coast Survey, $13,000 a year, making for rents alone $115,530 annually. Mr. Clark, Architect of the Capitol, estimates the addition to the Capitol to cost $2,000,000. The additional grounds will cost at least one million more. Mr. Mullett, Architect of the Treasury, estimates the War and Navy Departments to cost $6,000,000; that it will cost $1,000,000 to extend the Treasury to complete the plan into Fifteenth street; $1,000,000 to put an addition needed on the Post Office; and $2,000,000 for a Department of Justice and Supreme Court-house. When we compare cost with estimates we can well add 20 per cent. This will run up the amount to at least $15,000,000 to be expended within a few years in new structures, or additions to old ones. Before these extensive and costly structures are erected, would it not be well to pause and consider whether there may not be a better location for all that may be erected? Whether it would not be real economy to place them in such a position as that a change might not be effected hereafter?

A comparison of our buildings with those of St. Petersburg, Berlin, Paris, and London shows what we need and must have, and what we will have within fifty years to come. The vast room required for the arrangement and deposit of the records and papers of the various offices, as well as the amount of room needed for the transaction of business, will call from time to time for large additional structures. At this time, as an instance, there is a demand by the Secretary of the Treasury, indorsed by the Committee on Appropriations, for a large and expensive building which, when completed, with its machinery, will cost half a million dollars, for the printing of currency and bonds. There is also a demand by the Public Printer for large additions to the building occupied by him for printing and binding, costing many thousands of dollars. The President's House is deemed by many to be insufficient, and

in a few years at most will be dispensed with, when another structure upon other grounds will need to be erected at a large expense. There is a project of enlarging the Capitol grounds by the purchase of two squares with the buildings, involving the outlay of at least $1,000,000, and this measure has thrice passed the Senate, and has been defeated only for a time, to be pressed with more and more vigor till it is accomplished. There is another project to create a grand park extending from the Capitol grounds to the President's House, involving very heavy expenditures, whether a half million or a million dollars we cannot say.

But outside of all these expenses are the street, avenue, and public square improvements; the making of roads and bridges; the continuation and repair of water-works; the improvement of the canal; the payment for the city police; the salaries of District officers; the support of the charitable institutions of the District; the care of the insane, the deaf and dumb, the poor, the sick and infirm in hospitals and asylums, making in all an annual outlay of hundreds of thousands of dollars. The Metropolitan Police alone costs $207,000 this year, and required $211,000 last year. The Deaf and Dumb Asylum costs about $40,000 a year; many of the inmates of this asylum are from points out of the District, but at least a third is chargeable to the District. The Lying-in Hospital required last year $18,000, and the Association for Destitute Colored Women, $10,000. The water-works last year got appropriations of $120,000; this year, $110,000. The canal got an appropriation of $50,000. The streets, alleys, squares, and bridges got last year $80,000; this year about $130,000. Here is an aggregate of half a million dollars which should be borne by the citizens of the District, but which is drained from the Treasury. Every year witnesses a renewal of these demands and appropriations, or similar ones to them. We deem it proper to call public attention to these large expenditures, which are, in a great measure, unnecessary for the public service in the administration of the Government, and which, in our judgment, should not be incurred. They seem to be inseparably connected with the Capital and the District as now organized, and no doubt will, as time passes, be gradually increased.

We believe that by a change of the location of the Capital the Government could rid itself of the great burdens imposed by reason of the present city and District system. Were the public buildings located in one place, convenient to each other in grounds properly arranged, there need be none of the outlays now required for streets, alleys, bridges, roads, squares, reservations, canals, hospitals, asylums, poor-houses, jails, police, and water-works large enough for a large city. This whole burden may be taken off at once. We believe that the Government can procure a tract of land sufficiently large for its use as a capital and district, and from the proceeds of lots sold, in connection with the express understanding that all civil and municipal expenses whatever are to be borne by the purchasers, derive a sum sufficient to erect a large part of the buildings as commodious and handsome as those now in use. And in view of this proposition and the prospective structures required here, we believe that no further appropriations for permanent public structures should be made in this District.

In coming to these conclusions we have not been unmindful of the condition of public opinion in reference to this question. When the legislatures and conventions of such States as Indiana, Illinois, Missouri, and Iowa, speak with great unanimity on the subject, and a very large portion of the citizens of the country are dissatisfied with the present location, it may be regarded as more appropriate to ask early action up-

on it. We have not been able to learn that this movement has its origin in any feeling of hostility to the city of Washington, or the District of Columbia, or any narrow and selfish desire of gain, or sectional and local prejudice, but we are fully convinced that it rests upon a great and patriotic purpose to rescue the seat of Government from the possibility of such influences, from the dangers of foreign invasion, from the bane of secession, from any taint of the spirit of treason, and to place it where no hostile power could ever threaten its safety; where the entire popular sentiment is national; where the combined wealth, power, intelligence, taste, public spirit, and patriotic pride of the surrounding people shall give it the grand position our national capital deserves.

The capital of this nation, if favorably located, is destined to be a great city. It must be the center of attraction of the active, earnest, progressive, thinking, and working men of the nation; it must be the focus of the great ideas and projects which are to stimulate and advance the successive generations that dwell on this continent. It must be the residence of thousands and tens of thousands of the great, and wise, and good, who will, as time progresses, make illustrious our history. It must ultimately be the great city of the civilized world. Our population will rise as easily to a hundred millions, and from that to two hundred millions, as it has from three to thirty-eight millions. When a hundred millions dwell under the protection of our power who can now measure the grandeur of their capital city? Who can now, with good reason, say that the structures we have already erected are a tithe of what will then be needed, and that for the comparatively small expenditure that has been made, the seat of Government shall be retained in an unfavorable location?

Profoundly impressed with the importance of this subject, we propose the following resolutions as expressive of the true policy to be pursued in relation to this matter:

Resolved, That it is the duty of Congress to make no further appropriations for the erection of permanent and costly structures for the use of the Government in the District of Columbia.

Resolved, That a commission of seven persons be elected by the Senate and House of Representatives of the United States, to select a place for the future seat of Government of the United States, subject to confirmation by Congress.

JOHN COBURN.
PHILETUS SAWYER.

EXHIBIT No. 1.

Letter from the Secretary of the Treasury in answer to a resolution of the House of February 11, transmitting a statement of the expenditures for public purposes in the District of Columbia from the establishment of the seat of Government to the 31st of December, 1869.

TREASURY DEPARTMENT,
February 19, 1870.

SIR: In compliance with the resolution of the House of Representatives dated the 11th instant, I have the honor to transmit herewith two statements, prepared by the Register of the Treasury, together with an explanatory letter from said officer, which contain all expenditures from the national Treasury for public and private purposes in the District of Columbia, (excluding the salaries of public officers,) from the time the seat of Government was located at Washington until the 31st day of December, 1869.

I am, very respectfully,

GEO. S. BOUTWELL,
Secretary of the Treasury.

Hon. J. G. BLAINE,
Speaker House of Representatives, Washington.

TREASURY DEPARTMENT, REGISTER'S OFFICE,
February, 1870.

SIR: I have the honor to transmit herewith two statements, embracing all expenditures from the national Treasury, for public and private purposes, in the District of Columbia, (excluding the salaries of public officers,) from the time the seat of Government was located at Washington to the 1st of January, 1870, furnished in compliance with a resolution of the House of Representatives of the 11th instant, referred to this office on the 14th instant.

No. 1 is a copy of a statement prepared in this office under date of September 11, 1858.

No. 2 is a continuation of that statement to the 1st of January, 1870.

The resolution calls for a statement to the close of the fiscal year ending June 30, 1869. A request for the same information to the 1st of January, 1870, having been complied with recently, is the reason for now furnishing the expenditures to a later period than the time mentioned in the resolution.

As requested, the resolution is herewith returned.

Very respectfully, your obedient servant,

JOHN ALLISON, *Register*.

Hon. GEORGE S. BOUTWELL,
Secretary of the Treasury.

No. 1.—*Statement of all the expenditures from the national Treasury for public and private purposes in the District of Columbia, (excluding the salaries of public officers,) from the time the seat of Government was located at Washington to the close of the fiscal year ending June* 30, 1858.

Support of Columbia Hospital for Women, &c., of District	45,000 00
Construction of a police telegraph in city of Washington	15,000 00
Market house and bridge in Georgetown	13,000 00
Removing stables from grounds around Washington Infirmary	4,999 22
Purchase of sites for school-houses	10,000 00
Hospital Washington City	114,611 55
House of Correction	12,000 00
Support of Freedmen's Hospital and Asylum	78,000 00
Warden of jail	700 00
Transient paupers	6,000 00
Primary schools for District	10,000 00
Hospital for women lying in, &c	15,000 00
	3,085,553 17

There has also been expended for bridges, Pennsylvania avenue, and water-works, the following sums:

For bridges in the city and District	$665,562 91
Pennsylvania avenue	463,223 50
Washington Aqueduct	3,352 931 08

A very large amount has in addition been expended upon other avenues and streets.

EXHIBIT NO. 4.

The following statements of the officers of the Government show the demand for rooms and the rents paid annually for public use:

TREASURY DEPARTMENT,
Washington, D. C., February 27, 1871.

SIR: I am directed by the Secretary to reply to your note in relation to the rent paid for offices by the several Departments in this city.

The rent paid by this Department I will give you at once, but that for the other Departments it will take some time for us to prepare. At present we are renting but one building for the use of the Treasury Department, known as the McKean Building, corner of Seventeenth street and New York avenue, for which we pay a monthly rental of $100. Under the act organizing the Department of Justice, it was made my duty to provide rooms for the accommodation of the additional officers provided for in that law, and for this purpose I have rented part of the Hooe building, on F street, between Thirteenth and Fourteenth streets, for which we pay $280 per month. And the Coast Survey Office at $13,000 a year. These are all the buildings which are rented for the accommodation of our Department. Unless, however, some provision is made for the accommodation of the Bureau of Engraving and Printing, it will be necessary for us to rent additional quarters for part of the Third Auditor's Office, and for one other Bureau of the Department, as the present state of this building is so crowded as to render it impossible to accommodate the employés required to do the business. From the 1st of July next it is anticipated that we will be compelled to rent the building now being [erected for the Freedmen's Savings Institution, for which they ask an annual rental of $7,500.

Very respectfully,

J. H. SAVILLE, *Chief Clerk.*

Hon. JOHN COBURN,
Chairman of Committee on Public Expenditures.

DEPARTMENT OF THE INTERIOR,
Washington, D. C., March 1, 1871.

SIR: In compliance with the request contained in your letter of the 27th instant, I have the honor to inform you that this Department pays the following sums for rent

of nine buildings, now occupied by the clerical force of the Bureaus of this Department, viz:

For the use of the Pension Office:

Building corner of Eighth and G streets	$9,000
Building numbered 707 G street	1,600
Building numbered 711 Eighth street	880
Building numbered 709 G street, for the joint use of the Pension Office and Bureau of Education	1,800
Total	13,280

The rent of these buildings is paid out of an appropriation for additional rooms for the use of the Department of the Interior. (See page 302, Statutes at Large, 1870.) In addition to the above, there are five buildings rented for the use of the clerical force of the Census Office, viz:

Three buildings on Eighth street between G and H streets, renting for	$5,400
One building on Eleventh street, (No. 521)	900
One building on Eighth street, (No. 512)	1,500
Total	7,800

The rent for these buildings is paid out of the appropriation for taking the ninth census. Total number of rented buildings, 9; total number of rooms, 143; total rent paid for nine buildings, $21,080.

I would also respectfully inform your honorable committee that of these nine rented building but one is considered fire-proof. The majority of them are ordinary buildings, and are liable to be destroyed by fire, together with the valuable records and documents necessarily placed in them.

The buildings before referred to were all rented by my predecessor except the one on Eighth street, numbered 512, which is used for the benefit of the Census Bureau, and is rented at $1,500.

Very respectfully, your obedient servant,

C. DELANO, *Secretary.*

Hon. JOHN COBURN,
House of Representatives.

WAR DEPARTMENT,
Washington City, March 2, 1871.

SIR: I have the honor to acknowledge the receipt of your letter of the 27th ultimo, asking, on behalf of the Committee on Public Expenditures, to be informed of the amount of rent paid for offices by the War Department and number of rooms occupied in this city.

I inclose a statement showing the amount paid by John Potts, disbursing clerk of the War Department, for rent of offices and number of rooms occupied. Amount paid, $14,000 per annum. Also similar statement of amount paid by the Quartermaster's Department, being $41,180 04 per annum; total, $55,180 04.

Very respectfully, your obedient servant,

WM. W. BELKNAP,
Secretary of War.

Hon. JOHN COBURN,
House of Representatives.

Statement showing the number of rooms occupied in each of the buildings hired by Captain William Myers, assistant quartermaster United States Army, for offices in this city.

Designation.	Entire No. of rooms.	No. of rooms occupied.	For what purpose.
Building corner of Fifteenth and G streets	59	46	Quartermaster General's office.
Building No. 531 Seventeenth street	10	10	Branch of Adjutant General's office.
Building No. 533 Seventeenth street	9	7	Do.
Building No. 620 Seventeenth street	4	4	Do.
Building No. 720 Seventeenth street	14	14	Do.
Building No. 1704 G street	8	8	Do.
Building No. 1705 G street	9	6	Do.
Building Nos. 1707 and 1709 New York avenue	7	7	Do.
Building No. 1719 G street	10	10	Signal office.
Building No. 616 Eighteenth street	11	11	Dr. Baxter's office.
Building No. 700 Nineteenth street	11	11	Depot quartermaster's office.
	152	134	

$41,180 04 per annum.

I certify that the above is correct.

WM. MYERS,
Captain and Depot Quartermaster.

Statement of the amount of rent paid by the disbursing clerk of the War Department for buildings occupied by Bureaus of the War Department, and the number of rooms in each building.

Building corner of F and Fifteenth streets, 32 rooms, occupied by Paymaster General, owned by W. W. Corcoran, per annum $7,500
Building near Fifteenth street on Pennsylvania avenue, 16 rooms, occupied by Surgeon General, owned by W. W. Corcoran, per annum 3,200
Building corner H and Sixteen-and-a-half streets, 24 rooms, occupied by the Commissary General, owned by heirs of John Gadsby, per annum 3,300

JOHN POTTS,
Disbursing Clerk, War Department.

WAR DEPARTMENT, *March* 1, 1871.

TREASURY DEPARTMENT,
Washington, D. C., March 4, 1871.

SIR: In compliance with your verbal request of yesterday, I have obtained the information from the Navy, State, and Post Office Departments, in relation to the buildings rented by them in this city, and I herewith inclose their letters.

Very respectfully,

J. H. SAVILLE, *Chief Clerk.*

Hon. JOHN COBURN, M. C.

DEPARTMENT OF STATE,
Washington, March 4, 1871.

DEAR SIR: This Department is now paying rent for the building it occupies at $15,000 per annum; for a house opposite, used principally for storage, $750 per annum; for the house No. 1412 H street, used by the Mexican Commission, at $3,000 per annum.

Very respectfully, yours,

R. S. CHEW, *Chief Clerk.*

J. H. SAVILLE, Esq.,
Chief Clerk, &c.

NAVY DEPARTMENT, *Washington, March* 4, 1871.

MY DEAR SIR: I have to inform you, in answer to your inquiry of this date, that the Navy Department is paying at the rate of $3,020 per annum for buildings occupied (in Washington) by its officers.

Very respectfully, &c.,

HOLMES E. OFFLEY, *Chief Clerk.*

J. H. SAVILLE, Esq.,
Chief Clerk, Treasury Department.

TREASURY DEPARTMENT,
OFFICE OF SUPERVISING ARCHITECT,
March 2, 1871.

SIR: I have the honor to transmit the following replies to your questions, which, I believe, cover the entire ground, and I trust will be satisfactory to you:

Answer to question No. 1. The buildings, in my opinion, absolutely needed for the use of the Government in this District at present are, 1st. A new building for the State, War, and Navy Departments, at a cost of $6,000,000, to be expended during a period of five years. 2d. A brick building for the printing business of the Treasury Department, at a cost of about $200,000. 3d. The alterations in the east front of the Treasury Department made necessary by the recent changes in the grade of Fifteenth street, at a cost not to exceed $100,000. 4th. An addition to the Government Printing Office, at a cost not to exceed $100,000.

In addition to these, in my judgment, it would be well for the Government to erect a building for the Department of Justice and the United States courts, at a cost not to exceed $2,000,000. This would restore to the Treasury Department the rooms now occupied by the Attorney General, and would make it unnecessary to extend the Capitol. This is, in my opinion, much cheaper and more desirable than extending the east front of the Capitol, and I also believe that it would provide the additional accommodations so much needed by Congress in the cheapest manner, as the space now occupied by the court rooms in the Capitol could then be used for the business of Congress.

Answer to question No. 2. As regards this question, I believe that within twenty years public sentiment will demand a new Executive Mansion, though the erection of such a building would not be considered a necessity in any other point of view, the present one being a substantial and durable structure; though undoubtedly rather small.

I am also of the opinion that the Post Office Department will require additional space before twenty years shall have elapsed, in which case it can readily be provided by the addition of an attic story, which, if properly designed, would add greatly to the architectural appearance of the building. The cost of such an addition would probably not exceed $1,000,000.

Beyond these I know of no other buildings that the necessities of the Government would require in this city, though I should be glad to see the improvements I have suggested on the east front of the Treasury carried out, which, as explained in my previous letter, could not be done for a less sum than $1,000,000. This, however, is not a matter of necessity, but a question of taste, as before stated.

Answer to question No. 3. I am thirty-eight years of age; by profession an architect and engineer; and am at present supervising architect of the Treasury Department.

Very respectfully,

A. B. MULLETT,
Supervising Architect.

Hon. JOHN COBURN,
Chairman Committee on Public Expenditures, House of Representatives.

EXHIBIT No. 5.

ARCHITECT'S OFFICE, U. S. CAPITOL EXTENSION,
Washington, D. C., February 6, 1871.

SIR: In reply to yours of the 4th instant, requesting a statement of the contemplated additions proposed in the completion in the United States Capitol and grounds, and the cost thereof, I have the honor to submit the following. In order to make an architectural unity of the eastern front, and to get the additional rooms required for public business, it is absolutely necessary to extend that front in advance of the line of the wings. By so doing the dome, the base of which now overhangs the eastern wall, will be placed in its right position, and the central portico will be made the most prominent feature in the principal front.

The time will soon be at hand when it will be necessary to find more room for the Congressional Library, to obtain which it has been suggested that the portico of the central portion of the eastern front be extended and finished with a pediment.

The costs of these additions should not exceed $2,000,000. In the matter of the extension and improvement of the grounds, I am of the opinion that the expenditure of $1,000,000 will be pay for the land to be acquired, and for all the filling, grading, paving, planting, and fencing.

Very respectfully, your obedient servant,

EDWARD CLARK, *Architect.*

Hon. JOHN COBURN,
Chairman Committee on Public Expenditures.

O

41ST CONGRESS, 3d Session. | HOUSE OF REPRESENTATIVES. | REPORT No. 53.

WILLIAM AND MARY COLLEGE, VIRGINIA.

MARCH 3, 1871.—Ordered to be printed and recommitted.

Mr. ARNELL, from the Committee on Education and Labor, made the following

REPORT.

The Committee on Education and Labor, to whom was referred the petition of President Ewell and others, of William and Mary College of Virginia, report thereon as follows:

The college of William and Mary, which is now asking Congress for aid, is nearly two centuries old, and is in age next to Harvard; indeed, its germ was planted in Virginia before Harvard existed, and before the Pilgrims landed. In wealth, it was in 1776 without an equal in the colonies. In respect to its national character, and to the distinguished names on its roll of graduates, it may be called the Harvard or Yale of the South. Thomas Jefferson, James Monroe, Chief Justice Marshall, Peyton Randolph, Edmund Randolph, Judge Bushrod Washington, John Randolph of Roanoke, Winfield Scott, John J. Crittenden, and many other men of mark, were among its alumni. George Washington received his diploma of surveyor from its faculty, and was, for the last ten years of his life, its chancellor. Its influence in forming the character of the men who were the pride of the nation, as well as of the Old Dominion, is undoubted. The Revolution took from it most of its endowments, including the charity of Robert Boyle. Its buildings were seriously injured during the campaign before Yorktown in 1781. In 1859 its main building was entirely destroyed by fire, and had scarcely been rebuilt, when it was again burned during the occupation of Williamsburg by the Union forces—described by General Meade as "one of those deplorable acts of useless destruction which occur in all wars." Subsequently other houses and other property were destroyed—the whole valued under oath at $69,000—all by Union soldiers. The proof of this, consisting of the affidavits of eye-witnesses, is full and convincing. Its losses during the rebellion are believed to be greater than those of the collegiate institutions of the South combined, except two which were under active military organizations. As an innocent victim of the rebellion, and a claimant of your sympathy, because of its revolutionary losses, it petitions Congress for help. The legislature of Virginia, without regard to party, and the executive of the State, unite in the petition. The people of the State feel deeply interested in its success.

The President and other Government officers of the highest rank, some of the most distinguished of those connected with the leading institutions of the North, and the friends of education everywhere, generously commend the cause of this college to favor.

This college is now affording all the help its limited means will allow

to the impoverished young men of the State who are seeking an education.

Because of its old name and national fame, its losses of endowment when American independence was established, and when Virginia ceded to the United States the northwestern territory; because institutions of learning ought to be respected in war, and more especially one the object of which was to save and restore, not to destroy; because of its excessive losses, seriously impairing its capacity for future usefulness, unless aid is afforded; because of the great importance of assisting, in every proper way, the educational interests of the South; and because of the widespread wish throughout the country to see this old historic landmark restored to efficiency, an appropriation is recommended. Therefore,

Resolved, That the sum of $65,000 be, and is hereby, appropriated out of the Treasury of the United States for the benefit of William and Mary College of Virginia.

Remarks of Professor Benjamin S. Ewell, President of the college of William and Mary, in support of the petition of the visitors and faculty of the institution to Congress for aid, made January 30, 1871.

May it please you, Mr. Chairman and gentlemen of the committee, [Education and Labor, House of Representatives:] The petition of the visitors and faculty of the College of William and Mary, and the accompanying letters and affidavits, explain so clearly the appeal made to Congress on its behalf, that I do not think it necessary to trespass further on your time than to call your attention to some of the points made in the memorial, and to mention some additional facts. And, first, let me allude briefly to the origin and early history of this institution.

Its germ was planted in the colony of Virginia as early as 1619, before Plymouth Rock received the Pilgrims, and was uprooted and destroyed by the Indian massacre of 1622. Owing to the disturbed condition of the mother country, culminating in civil war and the dethronement and execution of Charles I, and the discontent in the colony, due to the arbitrary and tyrannical course of the royal governor, Sir William Berkeley, which caused Bacon's rebellion, during which Jamestown, the then capital of the colony, was besieged, captured, and burned, no serious attempt to reëstablish the college was made till after the revolution of 1688; and as an "offspring of this revolution, its sons were the warm and enthusiastic advocates of that of 1776."

In 1693 the English sovereigns, William and Mary, chartered and richly endowed the college of William and Mary; and it is believed to be the only college in the United States that received a strictly royal charter. From 1693 to the beginning of the revolutionary war, it was the constant recipient of substantial favors from the kings, lords, and commons of England. Its charter gave it a duty of one penny a pound on tobacco exported from the colonies of Virginia and Maryland, and made it surveyor general of the Territory of Virginia, in virtue of which the selection and appointment of all deputy surveyors were vested in the college, with the right to a part of their fees. Thus George Washington, in one sense an alumnus of the institution, (for in its halls he was given his diploma as surveyor, after an examination by its professors,) Zachary Taylor, grandfather of the President of the same name, Peter Jefferson, father of Thomas Jefferson, and a little later Thomas Jefferson himself, were among those appointed surveyors. From these and other sources, a large and constantly increasing revenue was derived till 1776; then it was the richest college in America, and there was every prospect of its remaining so. Harvard was, up to this time, its pensioner; the Boyle fund being held in trust by William and Mary on condition of the annual payment of ninety pounds sterling to Harvard. Well might these institutions, the oldest on the continent, exclaim, in view of their past and present relative condition, "*Tempora mutantur et nos mutamur in illis.*"

The war which established American independence reduced William and Mary to comparative poverty, by depriving it of the export duty on tobacco and the Boyle fund; while the cession by Virginia of the Northwestern Territory rendered the office of surveyor general, which it held till 1817, profitless. Its buildings, during and after the siege of Yorktown in 1781, were occupied as hospitals by the French and Americans, and, while thus occupied, were much damaged by fire. The French government rebuilt or repaired at once the buildings injured while in possession of its soldiers; no compensation has ever been obtained for the damage done by the continental soldiers,

though applications have been made to Congress, the last in 1854, when a petition with the necessary proofs was presented to the Senate of the United States, and referred to a committee of that body. If these losses of chartered rights and of property, the direct consequence of the revolutionary struggle, and the further losses resulting from the cession by Virginia of an empire of territory, do not establish a legal claim, they surely warrant an appeal to your sympathy and good-will. For this reason they are mentioned.

But the college did not remain an idle spectator of the events of 1776 and the following years. It entered actively into the contest, furnishing to it the author of the Declaration of Independence, who first proclaimed that the motto of free America ought of right to be, "Universal emancipation and universal education;" the president of the first American Congress, five signers of the Declaration, and a large number, besides, of devoted patriots and soldiers. It has since given three Presidents to the United States, one (the first) chief justice, the first attorney general, one general-in-chief of its armies, and others distinguished as statesmen, jurists, and soldiers. Excepting Harvard and West Point, it has gone beyond all of our literary institutions in its national character and services.

After the Revolution it continued its educational functions with good success, till, in 1859, it lost, by an accidental fire, its main building, planned by Sir Christopher Wren, and erected nearly two centuries before, with a valuable library and apparatus. "When this building was erected," to adopt the language of a distinguished statesman and alumnus of the college, "it looked out upon a country in the early infancy of settlement, containing a population not greater than that which at this day is found in the smallest State of the Union. It beheld that population expanding over regions bounded by two great oceans, to be counted by millions, in place of the scattered thousands of that day. It has seen the colonies shake off the badges of puberty and put on the *toga virilis*. It saw the Congress before and after it had assembled under the articles of confederation, and those articles substituted by the Constitution under which it is now our happiness to live. It reëchoed the words of the forest-born Demosthenes in 1765, asserting the rights of America to be 'natural, constitutional, and chartered;' and in thunder tones, at an after-day, its walls resounded to the words, 'Liberty or Death,' uttered by the same eloquent lips. Under the influence of its teachings, its students threw aside their volumes, and girded on the sword to do battle in the great cause of liberty. The silver-toned voice of Philosophy heard within its walls has been ofttimes hushed by the clangor of drums and trumpets. At one time it gave reluctant shelter to the British troops as they passed on to Yorktown; and soon after its gates were opened wide to give willing and exultant reception to the troops with their tattered banners which followed Cornwallis to his last retreat. Its walls were alternately shaken by the thunder of the cannon at Yorktown and the shouts of the noble bands who fought and conquered in the name of American independence. The boy had gone forth with the surveyor's staff, which it had placed in his hands, into the wilderness of the West, and now returned the hero and the conqueror, and once more stood within its walls surrounded by the chivalry of France and America, wearing on his brow imperishable laurels, and making the name of Washington foremost on the rolls of fame."

In 1860 the losses by the fire of 1859, as well in building as in library, apparatus, and furniture, were fully restored, and there was every indication of a long career of prosperity and usefulness.

To quote from a recently published historical sketch of the college: "Early in May, 1861, the existence of actual war at its very threshhold [it is distant from Fort Monroe about thirty-five miles] rendered it necessary to suspend academic exercises, and to close its doors." The building was immediately seized by the military, and used first as a barrack and next as a hospital, until the evacuation of the Peninsula in May, 1862.

Williamsburg is, to a force holding the James and York Rivers, the key of the lower portion of the Peninsula. The tides ebb and flow in deep creeks, flanked by impassable morasses, within a mile of the town. The position is a narrow gorge, where the roads, from above and below, converge. It was therefore held as an important post, by the United States forces, till the close of the war. At times, however, it was contended for by the opposing troops. After a conflict, on the 9th of September, 1862, between the garrison and a body of South Carolina cavalry, the latter got possession of the place, and held it a few hours. After their withdrawal, returning stragglers of the garrison, provoked by defeat, and under the influence of drink, fired and destroyed the main building, with furniture and apparatus, while in a state of disorder and disorganization. At later periods all the remaining houses on the college premises, with the inclosures, were burned or pulled to pieces wholly or in part.

The buildings not destroyed and the grounds were held by the Union troops from May, 1862, to September, 1866, for depots and for other purposes; of all of which there is full proof in the papers filed with the petition. In relation to this, General Meade writes: "I am satisfied, on examination of the facts of the case, that the destruction of the buildings of William and Mary College by our troops was not only unnecessary and unauthorized, but one of those deplorable acts of useless destruction which occur

in all wars. In this view, and believing that its reconstruction under the direction and superintendence of Professor Benjamin S. Ewell will tend to cement and strengthen the bonds of union, and to give encouragement to the growth and spreading of sound Union principles, I take great pleasure in recommending the appeal of Professor Ewell to all those who may have the means and the disposition to assist him in the good work in which he is engaged. Professor Ewell's protest, recently published, against sectional text books, is evidence of his views on this important question of education."

But notwithstanding this and other outrages, greatly to be deplored, I feel rejoiced that as an eye-witness of many of the events of the war, as well in the West as in the East, I can testify that no war of equal or approximate magnitude and duration was ever waged in which the outrages were fewer; and in this I am sustained by the opinion of one of our most accomplished students of military history, General Joseph E. Johnston. That this should have been so, while engaged in a fierce civil war, is to the infinite honor of the American people.

Colonel Robert W. Hughes, the former able and accomplished editor of the Richmond State Journal, in a recent letter to the Hon. Charles H. Porter, writes that "a memorial, signed by the governor and all the members of the legislature, without distinction of party, has gone to Congress asking aid for the ancient college of William and Mary;" and that "the profoundest sympathies of our Virginia people are enlisted in the fortunes of this historical corporation, and we shall look with fond and earnest solicitude to the action which Congress shall take upon this memorial of our legislature. * * During the war of independence the buildings of William and Mary were repeatedly occupied by British troops. They were in every instance respected as sacred to the cause of letters, and left intact. After the close of the war Louis XVI, the ally of America, caused the buildings accidentally destroyed by his troops to be replaced, and every injury to be repaired, doing royal homage to the sacred cause of learning.

"In 1865, when General Sheridan passed through Charlottesville, the seat of the University of Virginia, he detached a faithful guard to protect the institution from all injury; and the fact is recorded to his enduring honor upon the archives of the university. Thus this noble institution, which Thomas Jefferson gave to his country, was fortunately preserved, although the more venerable college which gave him to America had fallen a victim to the Moloch of war.

"With such conspicuous examples of homage to learning, from kings and heroes, presented by the history of these two learned corporations of our State, I cherish the loyal belief that it will be only necessary to bring the facts of this case to the attention of Congress to secure from that body the action which is prayed for in the memorial to which I have referred. I refer you to the letters of Generals Grant, Sherman, Butler, Meade, McClellan, Schofield, Burnside, Chief Justice Chase, and of the Rev. Dr. Tyng, and the Rev. Henry Ward Beecher, generously commending the cause of this college to public favor."

The people of Virginia, their legislature, their executive, and the friends of education, and the educators everywhere, unite in this petition, not making a legal claim, but as the Union armies went to save and restore, not to destroy, asking that you aid in healing the wounds of war by restoring this ancient college to usefulness. No institution of learning in the South lost so much by the civil war, by actual destruction of property, by long suspension, and consequent inability to resume its exercises when peace was declared; save two, perhaps, the students of which, armed and organized as such, were actively engaged in the field in resisting the armies of the United States. Indeed, so far as my information extends, the losses of the college of William and Mary quadruple those of all other southern colleges combined, with the exceptions just mentioned.

Apprehensions have been expressed that if the prayer of this petition be granted a precedent would be established, justifying and encouraging large demands on the Treasury.

If my statement, as to the extent of damages by Union troops to colleges, be approximately correct, no great depletion of the Treasury could follow. But, remembering the losses of the college, when the United colonies fought and won freedom's battle, and when Virginia gave more States to the Union than framed the Constitution, and, further, its national character, I assert that a precedent could not thereby be established, for the case is *sui generis*, and has, and can have, no parallel.

Colonel Hughes, in his letter before referred to, says: "There has been no period in the history of the State in which the cause of education has so largely engrossed the thoughts of our people as at present; in which the necessity of making education as universal as the suffrage was more generally acknowledged, more apparent, and more urgent; and in which, unfortunately, the people were less able than they now are to accomplish the general desire in this important direction. To look over the State at the extent of ignorance prevailing among both races; to observe the magnitude of the work needed to be done; and to contrast this with the feebleness and paucity of our means for performing the task before us, fills the hearts of many of our most enlightened men with dismay."

In all this there is, I regret to say, no exaggeration. As an illustration of the extent

of ignorance among the whites, I will mention that last summer, in one of the oldest counties of Virginia, seven out of twelve of a jury of inquest, composed of grown white men, had to make their marks because they could not write their names. Without some outside help, and that speedily given, the rising generation will be more ignorant than the present. As a general thing both races eagerly look forward to the time when, through free schools, they may see their children getting what they themselves are too poor to give them, an education.

The college of William and Mary has been and is doing its part to remove this reproach. It has, notwithstanding crippled and diminished resources, and ruinous buildings, educated gratuitously, since the close of the war, upward of two hundred unable without such help to get an education. At the present time out of eighty pupils not less than one-half are admitted without charge.

Until 1776 the British government was the patron and benefactor of this college. Now an opportunity is afforded to bind it to the Government of the United States with enduring ties of gratitude and affection. If it be true, as is declared by one of the leading newspapers of this city, that some of the educational institutions of the South are nurseries of treason, how important does it become to cherish and nurture loyalty and love of the Union in such, whenever practicable; and the opportunity becomes doubly valuable, when a time-honored, well-established college like this is in question. Ten times the sum needed to give William and Mary power and efficiency might be expended in founding a new institution without a proportionate beneficial result.

I will conclude with another quotation from the historical sketch before mentioned:

"Surely those hallowed walls in which the calm voice of philosophy has for so many generations been heard, will not be allowed to stand, a blackened monument of the ravages of war, and a reproach to our age and people. On the contrary, new and more beautiful temples will arise to receive and welcome the genius of education, and to foster that philosophy and those arts and sciences the achievements of which it is the glory of a nation to honor as the noblest victories of peace."

Account in detail of damages to houses and other property of the college of William and Mary, at Williamsburg, Virginia, from May, 1862, till the close of the war, 1865, by United States soldiers.

Main college building, 140 feet by 100 feet, including wings, set on fire and destroyed, valued at	$40,000
A house—professor's dwelling, with outhouses, burned	5,000
College furniture and apparatus, all new, burned	6,000
The Brafferton, or Boyle house, and outhouses, pulled to pieces	5,000
College library, books taken, 4,000 volumes, some valuable	6,000
Devastation of grounds and inclosures destroyed	4,000
A house, partly pulled to pieces, all outhouses entirely so	3,000
	69,000

DISTRICT OF COLUMBIA, *County of Washington, ss:*

On this 31st day of January, 1871, personally appeared before me, a notary public within and for the district and county aforesaid, Benjamin S. Ewell, president of the college of William and Mary, and made oath that the above estimate of the value of the property of the college destroyed during the late civil war by United States soldiers is, to the best of his knowledge and belief, moderate and reasonable; that having superintended the construction of much of the property so destroyed, and been the disbursing agent of the college, he has had means of knowing the cost of such work; and further, that the property herein mentioned belonged to the college, and was destroyed by Union troops, as is set forth in the affidavits, to be found among the papers marked A, B, C, &c., and filed with the petition of the college to the Congress of the United States.

Sworn to and subscribed before me this 31st day of January, A. D. 1871.

FREDERICK KOONES,
Notary Public.
